1 Initial Code

In this part we define a few commands that are used later on.

\@ptsize

This control sequence is used to store the second digit of the pointsize we are typesetting in. So, normally, it’s value is one of 0, 1 or 2.

1 (*letter)
2 \newcommand\@ptsize{}

1.1 Setting Paper Sizes

The variables \paperwidth and \paperheight should reflect the physical paper size after trimming. For desk printer output this is usually the real paper size since there is no post-processing.

3 \DeclareOption{a4paper}
4 {\setlength\paperheight {297mm}\%
5 \setlength\paperwidth {210mm}}
6 \DeclareOption{a5paper}
7 {\setlength\paperheight {210mm}\%
8 \setlength\paperwidth {148mm}}
9 \DeclareOption{b5paper}
10 {\setlength\paperheight {250mm}\%
11 \setlength\paperwidth {176mm}}
12 \DeclareOption{letterpaper}
13 {\setlength\paperheight {11in}\%
14 \setlength\paperwidth {8.5in}}
15 \DeclareOption{legalpaper}
The option \texttt{landscape} switches the values of \texttt{\paperheight} and \texttt{\paperwidth}, assuming the dimensions were given for portrait paper.

\begin{verbatim}
\DeclareOption{landscape}{
  \setlength{\@tempdima}{\paperheight}\
  \setlength{\paperheight}{\paperwidth}\
  \setlength{\paperwidth}{\@tempdima}
}
\end{verbatim}

\subsection*{1.2 Choosing the type size}

The type size options are handled by defining \texttt{\@ptsize} to contain the last digit of the size in question and branching on \texttt{\ifcase} statements. This is done for historical reasons to stay compatible with other packages that use the \texttt{\@ptsize} variable to select special actions. It makes the declarations of size options less than 10pt difficult, although one can probably use 9 and 8 assuming that a class won\texttt{t} define both 8pt and 18pt options.

\begin{verbatim}
\DeclareOption{10pt}{\renewcommand{\@ptsize}{0}}
\DeclareOption{11pt}{\renewcommand{\@ptsize}{1}}
\DeclareOption{12pt}{\renewcommand{\@ptsize}{2}}
\end{verbatim}

\subsection*{1.3 Two-side or one-side printing}

Two-sided printing was not supported in the \LaTeX\ 2.09 version of this document class.

\begin{verbatim}
\if@compatibility
  \DeclareOption{twoside}{\latexerr{No 'twoside' layout for letters}\
    \@eha}
\else
  \DeclareOption{twoside}{\twosidetrue \@mparswitchtrue}
\fi
\DeclareOption{oneside}{\twosidetrue \@mparswitchfalse}
\end{verbatim}

\subsection*{1.4 Draft option}

If the user requests \texttt{draft} we show any overfull boxes. We could probably add some more interesting stuff to this option.

\begin{verbatim}
\DeclareOption{draft}{\setlength{\overfullrule}{5pt}}
\DeclareOption{final}{\setlength{\overfullrule}{0pt}}
\end{verbatim}

\subsection*{1.5 Equation numbering on the left}

The option \texttt{leqno} can be used to get the equation numbers on the left side of the equation.

\begin{verbatim}
\DeclareOption{leqno}{\input{leqno.clo}}
\end{verbatim}
1.6 Flush left displays

The option \fleqn redefines the displayed math environments in such a way that they come out flush left, with an indentation of \mathindent from the prevailing left margin.

\DeclareOption{fleqn}{\input{fleqn.clo}}

2 Executing Options

Here we execute the default options to initialize certain variables.

\ExecuteOptions{letterpaper,10pt,oneside,onecolumn,final}

The \ProcessOptions command causes the execution of the code for every option \texttt{foo} which is declared and for which the user typed the \texttt{foo} option in his \documentclass command. For every option \texttt{bar} he typed, which is not declared, the option is assumed to be a global option. All options will be passed as document options to any \usepackage command in the document preamble.

\ProcessOptions

Now that all the options have been executed we can load the chosen class option file that contains all size dependent code.

\input{size1@ptsize.clo}

3 Loading Packages

The standard class files do not load additional packages.

4 Document Layout

In this section we are finally dealing with the nasty typographical details.

4.1 Paragraphing

\lineskip \normallineskip These parameters control \TeX's behavior when two lines tend to come too close together.

\setlength\lineskip{1\p@}
\setlength\normallineskip{1\p@}

\baselinestretch This is used as a multiplier for \baselineskip. The default is to not stretch the baselines.

\renewcommand\baselinestretch{}

\parskip \parindent \parskip gives extra vertical space between paragraphs and \parindent is the width of the paragraph indentation. Letters are typeset without paragraph indentation.

\setlength\parskip{0.7em}
\setlength\parindent{0\p@}
The commands \nopagebreak and \nolinebreak put in penalties to discourage these breaks at the point they are put in. They use \@lowpenalty, \@medpenalty or \@highpenalty, dependent on their argument.

These penalties are used to discourage club and widow lines. Because we use their default values we only show them here, commented out.

Discourage (but not so much) widows in front of a math display and forbid breaking directly in front of a display. Allow break after a display without a penalty. Again the default values are used, therefore we only show them here.

Allow the breaking of a page in the middle of a paragraph.

We allow the breaking of a page after a hyphenated line.

4.2 Page Layout

All margin dimensions are measured from a point one inch from the top and lefthand side of the page.

4.2.1 Vertical spacing

The \headheight is the height of the box that will contain the running head. The \headsep is the distance between the bottom of the running head and the top of the text. \topskip is the \baselineskip for the first line on a page, its value depends on the size option that was specified. Therefore it is initialized in one of the size1x.clo files.

The distance from the baseline of the box which contains the running footer to the baseline of last line of text is controlled by the \footskip. Bottom of page:

4.2.2 The dimension of text

When we are in compatibility mode we have to make sure that the dimensions of the printed area are not different from what the user was used to see.
Now that we have computed the width of the text, we have to take care of the height. The \textheight is the height of text (including footnotes and figures, excluding running head and foot).

\setlength{textheight}{505\p@}
\fi

In native mode we use the dimensions as they were computed by one of the \texttt{xxpt} options, together with one of the \texttt{.paper} options.

4.2.3 Margins

The values of $\oddsidemargin$ and $\evensidemargin$ are computed from those of \paperwidth and \textwidth.

\setlength{oddsidemargin}{53pt}
\setlength{evensidemargin}{53pt}
\setlength{marginparwidth}{90pt}
\else
\setlength{oddsidemargin}{.5\@tempdima}
\setlength{evensidemargin}{{.5}@tempdima}
\setlength{marginparwidth}{90\p@}
\fi

The horizontal space between the main text and marginal notes is determined by $\marginparsep$, the minimum vertical separation between two marginal notes is controlled by $\marginparpush$.

\setlength{marginparsep}{11\p@}
\setlength{marginparpush}{5\p@}

$\topmargin$ is the distance between the top of ‘the printable area’ –which is 1 inch below the top of the paper– and the top of the box which contains the running head.

It can now be computed from the values set above.

\setlength{\topmargin}{27pt}

4.2.4 Footnotes

$\footnotesep$ is the height of the strut placed at the beginning of every footnote. It equals the height of a normal $\footnotesize$ strut in this class, thus no extra space occurs between footnotes.

\setlength{\footnotesep}{12\p@}

$\footins$ is the space between the last line of the main text and the top of the first footnote.

\setlength{\footins}{10\p@ \@plus 2\p@ \@minus 4\p@}
4.3 Page Styles

The page style foo is defined by defining the command \ps@foo. This command should make only local definitions. There should be no stray spaces in the definition, since they could lead to mysterious extra spaces in the output (well, that’s something that should be always avoided).

The $\ldots$ command defines the macros $\@oddhead$, $\@oddfoot$, $\@evenhead$, and $\@evenfoot$ to define the running heads and feet—e.g., $\@oddhead$ is the macro to produce the contents of the heading box for odd-numbered pages. It is called inside an hbox of width $\textwidth$.

4.3.1 Marking conventions

To make headings determined by the sectioning commands, the page style defines the commands $\chaptermark$, $\sectionmark$, ..., where $\chaptermark{\langle \text{text} \rangle}$ is called by $\chapter$ to set a mark, and so on.

The $\ldotsmark$ commands and the $\ldotshead$ macros are defined with the help of the following macros. (All the $\ldotsmark$ commands should be initialized to no-ops.)

\TeX{} extends \TeX{}’s $\mark$ facility by producing two kinds of marks, a ‘left’ and a ‘right’ mark, using the following commands:

$\markboth{\langle left \rangle}{\langle right \rangle}$: Adds both marks.

$\markright{\langle right \rangle}$: Adds a ‘right’ mark.

leftmark: Used in the $\@oddhead$, $\@oddfoot$, $\@evenhead$ or $\@evenfoot$ macros, it gets the current ‘left’ mark. leftmark works like \TeX{}’s $\botmark$ command.

rightmark: Used in the $\@oddhead$, $\@oddfoot$, $\@evenhead$ or $\@evenfoot$ macros, it gets the current ‘right’ mark. rightmark works like \TeX{}’s $\firstmark$ command.

The marking commands work reasonably well for right marks ‘numbered within’ left marks—e.g., the left mark is changed by a $\chapter$ command and the right mark is changed by a $\section$ command. However, it does produce somewhat anomalous results if two $\markboth$’s occur on the same page.

Commands like $\tableofcontents$ that should set the marks in some page styles use a $\@mkboth$ command, which is $\let$ by the pagestyle command ($\ps@\ldots$) to $\markboth$ for setting the heading or to $\@gobbletwo$ to do nothing.

4.3.2 Defining the page styles

The pagestyles empty and plain are defined in the \TeX{} kernel (ltpage.dtx), but these definitions are changed to a simpler version for this document class.

\ps@headings

The definition of the page style headings has to be different for two sided printing than it is for one sided printing.

81 $\if@twoside$

82 \def\ps@headings%  

83 $\let\@oddfoot\empty\let\@evenfoot\empty$

The running feet are empty in this page style.

83 \let\@oddfoot\empty\let\@evenfoot\empty
The running head contains some information about this letter. The head is the same for even and odd pages.

```latex
\def\@oddhead{\slshape\headtoname{} \ignorespaces\toname
    \hfil \@date
    \hfil \pagename{} \thepage}%
\let\@evenhead\@oddhead
```

For one sided printing we don’t need to define \@evenhead so the definition is somewhat simpler.

```latex
\else
\def\ps@headings{%
\let\@oddfoot\@empty
\def\@oddhead{\slshape\headtoname{} \ignorespaces\toname
    \hfil \@date
    \hfil \pagename{} \thepage}}
\fi
```

`\ps@empty` The definition of the page style `empty` is simple: No running head or foot at all.

```latex
\def\ps@empty{%
\let\@oddhead\@empty
\def\@oddfoot{\@empty}
\let\@evenhead\@empty
\let\@evenfoot\@empty%
```

`\ps@firstpage` The page style `firstpage` puts the telephone number in the proper place for the letterhead. It should be adapted to site conventions. The size of the number is determined depending on the main size.

```latex
\def\ps@firstpage{%
\let\@oddhead\@empty
\let\@oddfoot\@empty
\def\@oddhead{\slshape\headtoname{} \ignorespaces\toname
    \hfil \@date
    \hfil \pagename{} \thepage}}
```

`\ps@plain` The definition of the page style `plain` is again simple.

```latex
\def\ps@plain{%
\let\@oddhead\@empty
\def\@oddfoot{\normalfont\hfil\thepage\hfil}
\def\@evenfoot{\normalfont\hfil\thepage\hfil}
```

5 Document Markup

5.1 Global Declarations

The following declarations, shown with examples, give information about the sender:

- \texttt{\name{Dr. L. User}}: to be used for the return address on the envelope.

\newcommand{\name}[1]{\def\fromname{#1}}
\makelabels

We make sure that the internal control sequences that are used to store the information exist and are empty.

\makelabels The \makelabels declaration causes mailing labels to be made.

\makelabels is allowed only before the \begin{document} command.

5.2 The generic letter commands

\begin{letter} The letter environment creates a new letter, starting from page 1, with footnotes starting from 1 as well. (The first page is unnumbered.) It has a single argument, which is the addressee and his address, as in

\begin{verbatim}
\begin{letter}{Sam Jones \\
    Institute for Retarded Study\\
    Princeton, N.J.}
\end{letter}
\end{verbatim}
Local declarations, such as \texttt{\address}, can follow the \begin{letter}.

The \leavevmode and \ignorespaces commands are there for protecting against an empty argument.

The end of the environment possibly writes the address information on the .aux file.

\@processto gets the \toname and \toaddress from the letter environment's macro argument. \@xproc and \@yproc are auxiliary macros.

These are needed by \stopbreaks

These are needed by \stopbreaks

5.2.1 Page breaking control

When the command \stopbreaks is issued no page breaks should occur until \startbreaks is called.

\nobreakspace

\nobreakspaceex

\nobreakcr

10
This cancels the effect of \stopbreaks.
\startbreaks
\newcommand*{\startbreaks}{% 
  \let\\@normalcr
  \interlinepenalty 200%
  \def\par{@@par\penalty 200\relax}}
\stopbreaks
\longindentation
The size of the indent to use before the closing of the letter.
\longindentation = .5\textwidth
\indentedwidth
The width of the closing of the letter.
\indentedwidth = \textwidth
\advance\indentedwidth - \longindentation
\opening
Text is begun with the \opening command, whose argument generates the salutation, as in
\opening{Dear Henry,}
This should produce everything up to and including the ‘Dear Henry,’ and a \par command that follows. Since there’s a \vfil at the bottom of every page, it can add vertical fill to position a short letter. It should use the following commands:

- \toname : name part of ‘to’ address. Will be one line long.
- \toaddress : address part of ‘to’ address. The lines separated by \\
- \fromname : name of sender.
- \fromaddress : argument of current \address declaration—null if none. Should use standard institutional address if null.
- \fromlocation : argument of current \location declaration—null if none.
- \telephonenum : argument of current \telephone declaration—null if none.
\newcommand*{\opening}{[1]{\ifx\@empty\fromaddress
\thispagestyle{firstpage}\%
\{\raggedleft\@date\par\%
\else % home address
\thispagestyle{empty}\%
\{\raggedleft\begin{tabular}{l@{}}\ignorespaces
\fromaddress \par[2]\parskip%
\@date \end{tabular}\par\%
\fi
\vspace{2\parskip}%
\{\raggedright \toname \at \toaddress \par}%
\vspace{2\parskip}%
\#1\par\nobreak}
The body of the letter follows, ended by a \closing command, as in
\closing{Yours truly,}

This command generates the closing matter, and the signature. An obvious thing
to do is to use a \parbox for the closing and the signature. Should use the
following:

- \ifx\@empty\fromaddress\else
  \hspace*{\longindentation}\fi
- \ifx\@empty\fromsig\else \fromname\fi\strut

\newcommand\closing[]{{\par\nobreak\vspace{\parskip}\
obreak\stopbreaks
\noindent\parbox{\indentedwidth}{\raggedright
\ignorespaces #1\[6\medskipamount\]\
\ifx\@empty\fromsig\else \fromsig \fi\strut}\
\par}

Of these three, only \medskipamount is actually used above.

\newcommand\cc[]{{\par\nobreak\vspace{\parskip}\
obreak
\noindent\parbox[t]{\textwidth}{\@hangfrom{\normalfont ccname: }\ignorespaces #1\strut}\
\par}

\newcommand\encl[]{{\par\nobreak\vspace{\parskip}\
obreak
\noindent\parbox[t]{\textwidth}{\@hangfrom{\normalfont enclname: }\ignorespaces #1\strut}\
\par}

After the \closing you can put arbitrary stuff, which is typeset with zero
\parindent and no page breaking. Commands designed for use after the closing are:

\cc{Tinker\ Evers\ Chance}

which produces:
cc: Tinker
    Evers
    Chance

Note the obvious use of \parbox.

\encl{Foo(2)\ Bar}

which produces:
encl: Foo(2)
    Bar
The only thing \ps needs to do is call \startbreaks, which allows page breaking again.

\newcommand*{\ps}{\par\startbreaks}

\stopletter

The \stopletter command is called by \endletter to do the following:

- Add any desired fill or other material at the end of the letter.

- Define \returnaddress to be the return address for the mailing label. More precisely, it is the first argument of the \mlabel command described below. It should be defined to null if the return address doesn’t appear on the labels. Any command, other than \\, that should not be expanded until the \mlabel command is actually executed must be preceded by \protect. Whenever possible, \protect commands in the definition of \returnaddress—it’s much more efficient that way. In particular, when the standard return address is used, you should define \returnaddress to something like \protect\standardreturnaddress.

\newcommand*{\stopletter}{}

5.3 Customizing the labels

Commands for generating the labels are put on the .aux file, which is read in and processed by the \end{document} command. You have to define the following two commands:

- \startlabels: Should reset the page layout parameters if necessary.

- \mlabel{⟨return address⟩}{⟨to address⟩}: Command to generate a single label.

\returnaddress

The return address for the mailing labels can be stored in this macro.

\newcommand*{\returnaddress}{}

\labelcount

A register to count the labels

\newcommand{\labelcount}{\z@}

\startlabels

The following \startlabels command sets things up for producing labels in two columns of five 2” × 4-1/4” labels each, suitable for reproducing onto Avery brand number 5352 address labels.

\newcommand{\startlabels}{\labelcount\z@}

\pagestyle{empty}\
\let@texttop\relax
\topmargin -50\p@
\headsep \z@
\oddsidemargin -35\p@
\evensidemargin -35\p@
\textheight 10in
\textwidth 550\p@
\columnsep 26\p@
\ifcase \@ptsize\relax
\normalsize

\normalsize
\@startlabels
\@startlabels is the command name that is written to the .aux file. It is a no-op at first, and defined to be the same as \startlabels in the \begin{document} hook.
\let\@startlabels=&relax

\mlabel This command prints an address label; it is used when the user specified \makelabels in the preamble of his document. The command \mlabel takes two arguments; the second argument is supposed to be the address; the first argument can be used to print a return address. In this document class we ignore the first argument. Also the labels are supposed to be 2 inch high and 3.6 inch wide. When your address labels have a different you will have to define your own \mlabel command.
\newcommand*{\mlabel}[2]{% 
\parbox[b][2in][c]{262\p@}{\strut\ignorespaces #2}%=}

\@mlabel The macro \@mlabel is written to the .aux file instead of \mlabel. This allows us to make it a no-op by default, and then activate it in the \begin{document} hook.
\let\@mlabel=\@gobbletwo

5.4 Lists

5.4.1 General List Parameters

The following commands are used to set the default values for the list environment’s parameters. See the LATEX manual for an explanation of the meanings of the parameters. Defaults for the list environment are set as follows. First, \rightmargin, \listparindent and \itemindent are set to 0pt. Then, for a Kth level list, the command \@listK is called, where ‘K’ denotes ‘i’, ‘ii’, ..., ‘vi’. (I.e., \@listiii is called for a third-level list.) By convention, \@listK should set \leftmargin to \leftmarginK.

\leftmargin For efficiency, level-one list’s values are defined at top level, and \@listi is defined to set only \leftmargin.
\leftmargini \setlength{\leftmargini}{2.5em}
\leftmarginii The following three are calculated so that they are larger than the sum of \labelsep and the width of the default labels (which are ‘(m)’, ‘vii.’ and ‘M.’).
\leftmarginiii \setlength{\leftmarginiii}{2.2em}
\leftmarginiv \setlength{\leftmarginiv}{1.87em}
\leftmarginv
Here we set the top level leftmargin.

\setlength{\leftmargini}{1.7em}
\setlength{\leftmarginii}{1em}
\setlength{\leftmarginiii}{1em}
\setlength{\leftmarginiv}{1em}
\setlength{\leftmarginv}{1em}
\setlength{\leftmarginvi}{1em}

\labelsep
\texttt{\labelsep} is the distance between the label and the text of an item; \texttt{\labelwidth} is the width of the label.

\setlength{\labelsep}{5\p@}
\setlength{\labelwidth}{\leftmargini}
\addtolength{\labelwidth}{-\labelsep}

\partopsep
When the user leaves a blank line before the environment an extra vertical space of \texttt{\partopsep} is inserted, in addition to \texttt{\parskip} and \texttt{\topsep}.

\setlength{\partopsep}{0\p@}
\@beginparpenalty
These penalties are inserted before and after a list or paragraph environment.
\@endparpenalty
They are set to a bonus value to encourage page breaking at these points.
\@itempenalty
This penalty is inserted between list items.
\@beginparpenalty -\@lowpenalty
\@endparpenalty -\@lowpenalty
\@itempenalty -\@lowpenalty

\@listI \texttt{\@listI} defines top level and \texttt{\@listi} values of \texttt{\leftmargin}, \texttt{\parsep}, \texttt{\topsep}, \texttt{\itemsep} and \texttt{\@listi}
\@listi
We have to initialize these parameters.
\@listii
Here are the same macros for the higher level lists.
\@listiii
\@listiv
\@listv
\@listvi
\def\@listi{
\setlength{\leftmargin}{\leftmargini}\%\allowbreak
\setlength{\parsep}{0\p@}\%\allowbreak
\setlength{\topsep}{.4em}\%
\setlength{\itemsep}{.4em}}
\let\@listi\@listI

\def\@listii{
\setlength{\leftmargin}{\leftmarginii}\%
\setlength{\labelwidth}{\leftmarginii}\%
\addtolength{\labelwidth}{-\labelsep}

\setlength{\topsep}{.2em}\%
\setlength{\itemsep}{\topsep}}
\def\@listiii{
\setlength{\leftmargin}{\leftmarginiii}\%
\setlength{\labelwidth}{\leftmarginiii}\%
\addtolength{\labelwidth}{-\labelsep}

\setlength{\topsep}{.2em}\%
\setlength{\itemsep}{\topsep}}
\def\@listiv{
\setlength{\leftmargin}{\leftmarginiv}\%
\setlength{\labelwidth}{\leftmarginiv}\%
\addtolength{\labelwidth}{-\labelsep}

\setlength{\topsep}{.2em}\%
\setlength{\itemsep}{\topsep}}
\def\@listv{
\setlength{\leftmargin}{\leftmarginv}\%
\setlength{\labelwidth}{\leftmarginv}\%
\addtolength{\labelwidth}{-\labelsep}

\setlength{\topsep}{.2em}\%
\setlength{\itemsep}{\topsep}}
\def\@listvi{
\setlength{\leftmargin}{\leftmarginvi}\%
\setlength{\labelwidth}{\leftmarginvi}\%
\addtolength{\labelwidth}{-\labelsep}

\setlength{\topsep}{.2em}\%
\setlength{\itemsep}{\topsep}}
5.4.2 Enumerate

The enumerate environment uses four counters: enumi, enumii, enumiii and enumiv, where enumN controls the numbering of the Nth level enumeration.

\begin{verbatim}
5.4.2 Enumerate
The enumerate environment uses four counters: enumi, enumii, enumiii and enumiv, where enumN controls the numbering of the Nth level enumeration.
\end{verbatim}

The counters are already defined in the \LaTeX kernel (ltlists.dtx), but their representation is changed here.

\begin{verbatim}
\renewcommand\theenumi{\@arabic\c@enumi}
\renewcommand\theenumii{\@alph\c@enumii}
\renewcommand\theenumiii{\@roman\c@enumiii}
\renewcommand\theenumiv{\@Alph\c@enumiv}
\end{verbatim}

The commands \labelenumi ... \labelenumiv generate the label for each item.

\begin{verbatim}
\renewcommand\p@enumii{\theenumi}
\renewcommand\p@enumiii{\theenumi(\theenumii)}
\renewcommand\p@enumiv{\p@enumiii\theenumiii}
\end{verbatim}

5.4.3 Itemize

Itemization is controlled by \labelitemi, \labelitemii, \labelitemiii, and \labelitemiv, which define the labels of the various itemization levels: the symbols used are bullet, bold en-dash, asterisk and centered dot.

\begin{verbatim}
\renewcommand\labelitemi{\textbullet}
\renewcommand\labelitemii{\normalfont\bfseries \textendash}
\renewcommand\labelitemiii{\textasteriskcentered}
\renewcommand\labelitemiv{\textperiodcentered}
\end{verbatim}

5.4.4 Description

The description environment is defined here – while the itemize and enumerate environments are defined in the \LaTeX kernel (ltlists.dtx).

\begin{verbatim}
\newenvironment{description}
{\list{}{\labelwidth\z@ \itemindent-\leftmargin
\let\makelabel\descriptionlabel}}
{\endlist}
\end{verbatim}

To change the formatting of the label, you must redefine \descriptionlabel.

\begin{verbatim}
\newcommand*{\descriptionlabel}[1]{{\hspace{\labelskip}\normalfont\bfseries #1}}
\end{verbatim}
5.5 Defining new environments

5.5.1 Verse

The verse environment is defined by making clever use of the list environment’s parameters. The user types `\` to end a line. This is implemented by `\let`'ing `\` equal `\@centercr`.

```latex
\newenvironment{verse}
{\let\=\@centercr
 \list{}{\setlength\itemsep{\z@}%
 \setlength\itemindent{-15\p@}%
 \setlength\listparindent{\itemindent}%
 \setlength\rightmargin{\leftmargin}%
 \addtolength\leftmargin{15\p@}}%
 \item[]}
 \endlist
```

5.5.2 Quotation

The quotation environment is also defined by making clever use of the list environment’s parameters. The lines in the environment are set smaller than `\textwidth`. The first line of a paragraph inside this environment is indented.

```latex
\newenvironment{quotation}
{\list{}{\setlength\listparindent{1.5em}%
 \setlength\itemindent{\listparindent}%
 \setlength\rightmargin{\leftmargin}}%
 \item[]}
 \endlist
```

5.5.3 Quote

The quote environment is like the quotation environment except that paragraphs are not indented.

```latex
\newenvironment{quote}
{\list{}{\setlength\rightmargin{\leftmargin}}%
 \item[]}
 \endlist
```

5.5.4 Theorem

This document class does not define its own theorem environments, the defaults, supplied by the \LaTeX\ kernel (`ltthm.dtx`) are available.

5.6 Setting parameters for existing environments

5.6.1 Array and tabular

- `\arraycolsep` The columns in an array environment are separated by `2\arraycolsep`.
  ```latex
  \setlength\arraycolsep{5\p@}
  ``

- `\tabcolsep` The columns in an tabular environment are separated by `2\tabcolsep`.
  ```latex
  \setlength\tabcolsep{6\p@}
  ```
\textbackslash arrayrulewidth \textbackslash doublerulesep

The width of vertical rules in the array and tabular environments is given by \textbackslash arrayrulewidth.
\begin{verbatim}
330 \setlength\arrayrulewidth{.4\p@}
\end{verbatim}

The space between adjacent rules in the array and tabular environments is given by \textbackslash doublerulesep.
\begin{verbatim}
331 \setlength\doublerulesep{2\p@}
\end{verbatim}

5.6.2 Tabbing
\textbackslash tabbingsep

This controls the space that the \textbackslash \texttt{\texttt{\textbackslash}} command puts in. (See L\textsc{atex} manual for an explanation.)
\begin{verbatim}
332 \setlength\tabbingsep{\labelsep}
\end{verbatim}

5.6.3 Minipage
\textbackslash minipagerestore

The macro \textbackslash \texttt{\textbackslash minipagerestore} is called upon entry to a minipage environment to set up things that are to be handled differently inside a minipage environment. In the current styles, it does nothing.
\begin{verbatim}
\@minipagerestore
\end{verbatim}

\textbackslash mpfootins

Minipages have their own footnotes; \textbackslash \texttt{\textbackslash skip\textbackslash mpfootins} plays same rôle for footnotes in a minipage as \textbackslash \texttt{\textbackslash skip\textbackslash footins} does for ordinary footnotes.
\begin{verbatim}
333 \skip\mpfootins = \skip\footins
\end{verbatim}

5.6.4 Framed boxes
\textbackslash fboxsep

The space left by \textbackslash fbox and \textbackslash framebox between the box and the text in it.
\begin{verbatim}
334 \setlength\fboxsep{3\p@}
335 \setlength\fboxrule{.4\p@}
\end{verbatim}

5.6.5 Equation and eqnarray
\textbackslash theequation

The equation counter will be typeset using arabic numbers.
\begin{verbatim}
336 \renewcommand\theequation{\arabic\c@equation}
\end{verbatim}

\textbackslash jot

\textbackslash jot is the extra space added between lines of an eqnarray environment. The default value is used.
\begin{verbatim}
337 \% \setlength\jot{3pt}
\end{verbatim}

\textbackslash eqnum

The macro \textbackslash \texttt{\textbackslash eqnum} defines how equation numbers are to appear in equations. Again the default is used.
\begin{verbatim}
338 \% \def\eqnum{\theequation}
\end{verbatim}
5.7 Font changing

Here we supply the declarative font changing commands that were common in \LaTeX\ version 2.09 and earlier. These commands work in text mode and math mode. They are provided for compatibility, but one should start using the \text... and \math... commands instead. These commands are redefined using \@renewfontswitch, a command with three arguments: the user command to be defined; \LaTeX\ commands to execute in text mode and \LaTeX\ commands to execute in math mode.

\texttt{\rm \tt \sf}

The commands to change the family.

\texttt{\bf}

The command to change to the bold series. One should use \mdseries to explicitly switch back to medium series.

\texttt{\sl \it \sc}

And the commands to change the shape of the font. The slanted and small caps shapes are not available by default as math alphabets, so those changes do nothing in math mode. One should use \upshape to explicitly change back to the upright shape.

\texttt{\cal \mit}

The commands \cal and \mit should only be used in math mode, outside math mode they have no effect. Currently the New Font Selection Scheme defines these commands to generate warning messages. Therefore we have to define them ‘by hand’.

\footnoterule

Usually, footnotes are separated from the main body of the text by a small rule. This rule is drawn by the macro \footnoterule. We have to make sure that the rule takes no vertical space (see \texttt{plain.tex}) so we compensate for the natural height of the rule of 0.4pt by adding the right amount of vertical skip.

To prevent the rule from colliding with the footnote we first add a little negative vertical skip, then we put the rule and make sure we end up at the same point where we begun this operation.

\footnoterule

A counter for footnotes.
The footnote mechanism of \LaTeX{} calls the macro \texttt{@makefntext} to produce the actual footnote. The macro gets the text of the footnote as its argument and should use \texttt{@makefnmark} to produce the mark of the footnote. The macro \texttt{@makefntext} is called when effectively inside a \texttt{parbox} of width \texttt{columnwidth} (i.e., with \texttt{\hsize = columnwidth}).

An example of what can be achieved is given by the following piece of \TeX{} code.

\begin{verbatim}
\long\def\@makefntext#1{\@setpar{\@@par
\@tempdima = \hsize
\advance\@tempdima-10pt
\parshape \@ne 10pt \@tempdima}\par
\parindent 1em\noindent\hb@xt@z@{\hss\@makefnmark}#1}
\end{verbatim}

The effect of this definition is that all lines of the footnote are indented by 10pt, while the first line of a new paragraph is indented by 1em. To change these dimensions, just substitute the desired value for ‘10pt’ (in both places) or ‘1em’. The mark is flush right against the footnote.

In this document class we use a simpler macro, in which the footnote text is set like an ordinary text paragraph, with no indentation except on the first line of a paragraph, and the first line of the footnote. Thus, all the macro must do is set \texttt{\parindent} to the appropriate value for succeeding paragraphs and put the proper indentation before the mark.

\begin{verbatim}
\long\def\@makefntext#1{\noindent\hangindent 5\p@\hb@xt@5\p@{\hss\@makefnmark}#1}
\end{verbatim}

The footnote markers that are printed in the text to point to the footnotes should be produced by the macro \texttt{@makefnmark}. We use the default definition for it.

\begin{verbatim}
\% \def\@makefnmark{\hbox{$^\m@th$}}
\end{verbatim}

5.9 Words

\texttt{\ccname} This document class is for documents prepared in the English language. To prepare a version for another language, various English words must be replaced. All the English words that require replacement are defined below in command names.

5.10 Date

\texttt{\today} This macro uses the \TeX{} primitives \texttt{\month, \day} and \texttt{\year} to provide the date of the \LaTeX{}-run.

\begin{verbatim}
\newcommand*{\ccname}{cc}
\newcommand*{\enclname}{encl}
\newcommand*{\pagename}{Page}
\newcommand*{\headtoname}{To}
\end{verbatim}

\begin{verbatim}
\% \def\@makefnmark{\hbox{$^\m@th$}}
\end{verbatim}
5.11 Two column mode

\columnsep This gives the distance between two columns in two column mode.
\setlength{\columnsep}{10\p@}

\columnseprule This gives the width of the rule between two columns in two column mode. We
have no visible rule.
\setlength{\columnseprule}{0\p@}

5.12 The page style

We have plain pages in this document class by default. We use arabic page numbers.
\pagestyle{plain}
\pagenumbering{arabic}

5.13 Single or double sided printing

We don’t try to make each page as long as all the others.
\raggedbottom
\@texttop The document class letter sets \@texttop to \vskip 0pt plus .00006fil on the first
page of a letter, which centers a short letter on the page. This fil value may have to
be changed for other letterheads. This setting has to be done after \raggedbottom
is executed, since the latter sets \@texttop to \relax.
\def\@texttop{\ifnum\c@page=1\vskip \z@ plus.00006fil\relax\fi}

We always start in one column mode.
\onecolumn

Index

Numbers written in italic refer to the page where the corresponding entry is de-
scribed; numbers underlined refer to the code line of the definition; numbers in
roman refer to the code lines where the entry is used.
