The \anonchap package

Peter Wilson, Herries Press; maintained by Will Robertson

2009/08/03

Provides commands to make \chapter typeset like \section. Do not use with the tocbind package (which also supplies these commands).

1 Change history

v1.1a New maintainer (Will Robertson)

2 Usage:

\simplechapter[(name)] and \simplechapterdelim{(delim)} act together so that any subsequent \chapter commands, for example

\chapter{First} ... \chapter{Second}...

will be typeset in the style of a \section (or numbered \chapter*) as:

\langle name\rangle 1\langle delim\rangle First

\ldots

\langle name\rangle 2\langle delim\rangle Second

A subsequent \restorechapter command will reset the \chapter typesetting back to its default style.

Note that the argument to \simplechapter is optional, and that by default \simplechapterdelim is defined as

\newcommand{\simplechapterdelim}{\}

1
Extending the above example:

\simplechapter
\chapter{First}
...
\renewcommand{\simplechapterdelim}{:}
\chapter{Second}
...
\restorechapter \% restore before issuing
\% a modified \simplechapter
\simplechapter[Chap]
\chapter{Third}
...
\restorechapter
\chapter{Fourth}
...

Will be typeset as:

1 First
...
2: Second
...
    Chap 3: Third
...
    Chapter 4
    Fourth
    ...
