reledmac
Typeset scholarly editions with \LaTeX*

Maïeul Rouquette†
based on the original ledmac by
Peter Wilson
Herries Press
which was based on the original edmac, tabmac and edstanza by
John Lavagnino, Dominik Wujastyk, Herbert Breger and Wayne Sullivan.

Abstract
The reledmac provides many tools in order to typeset scholarly editions. It is
based on theeledmac package, which was based on the ledmac package, which
was based on the edmac \LaTeX package.
It can be used in combination with reledpar in order to typeset two texts in
parallel, like an original text and its translation in a modern language.
reledmac provides many tools and options. Normally, they are all documented
in this file. Also provided is a help folder, [examples]. The folder contains additional
examples (although not for every possible case). Examples starting with "1-" are for
basic uses, those starting with "2-" are for advanced uses.
To report bugs or request a new feature, please go to ledmac GitHub page and
click on "New Issue": https://github.com/maieul/ledmac/issues/. You must
create an account on github.com to access my page (maieul/ledmac). GitHub ac-
counts are free for open-source users. You can post messages in English or in French
(preferred).
You can subscribe to the reledmac mail list at:
http://geekographie.maieul.net/146

6 Apparatus commands

6.1 Terminology

6.2 Critical notes
   6.2.1 The lemma
   6.2.2 Footnotes
   6.2.3 Endnotes
   6.2.4 Paragraph in critical apparatus
   6.2.5 Change lemma and line number
   6.2.6 Changing the names of commands for critical apparatus

6.3 Disambiguation of identical words in the apparatus
   6.3.1 Basic use
   6.3.2 Case setting
   6.3.3 Notes about input encoding with UTF-8 processor
   6.3.4 Notes about right-to-left texts
   6.3.5 Use with \lemma command
   6.3.6 Sameword for a group of words
   6.3.7 Customizing
   6.3.8 Problems with some macros
   6.3.9 Automatic sameword annotation

6.4 Apparatus of manuscripts
   6.4.1 Marking sections of text
   6.4.2 Layout of the apparatus of manuscripts
   6.4.3 Settings

6.5 Familiar notes
   6.5.1 Basic use
   6.5.2 Customizing mark
   6.5.3 Separator for multiple footnotes

6.6 Printing the footnote mark without printing the footnote text

6.7 Changing series
   6.7.1 Create a new series
   6.7.2 Delete series
   6.7.3 Series order

6.8 Position of critical and familiar footnotes

7 Apparatus customization

7.1 Notes arrangement in a series

7.2 Control line number printing
   7.2.1 Print line number only at first time
   7.2.2 Print line number annotation only the first time
   7.2.3 Print page number only at first time
   7.2.4 Arbitrary text before line number
   7.2.5 Separator for line range
   7.2.6 Abbreviate line range
   7.2.7 Disable line number
   7.2.8 Printing pstart number
   7.2.9 Printing stanza number

1 Introduction

1.1 Aim of the package

The \texttt{reledmac} package, together with \LaTeX{}, provides several important facilities for formatting critical editions of texts in a traditional manner. Major features include:

- automatic stepped line numbering, by page, section or paragraph;
- sub-lineation within the main series of line numbers;
- variant readings automatically keyed to line numbers;
- caters to both prose and verse;
- multiple series of footnotes and endnotes;
- block or columnar formatting of the footnotes;
- simple tabular material may be line numbered;
- indexing keyed to page and line numbers.

\texttt{reledmac} allows the scholar engaged in preparing a critical edition to focus attention wholly on the task of creating the critical text and evaluating the variant readings, text-critical notes and testimonia. \LaTeX{} and \texttt{reledmac} will take care of the formatting and visual correlation of all the disparate types of information.
1.2 History

Apart from reledmac there are other \TeX\ packages for typesetting critical editions. However, the aim of reledmac is to provide an "all in one" and flexible tool in the field of critical editions.

Any suggestions for new features are welcome.

This manual contains a general description of how to use reledmac, followed by the complete source code and its extensive documentation (in sections II and following, enumerated with Roman numerals). It ends with a list of actions to do when migrating from one version to other, a change history and an index to the source code.

You do not need to read the source code for this package in order to use it; we provide this code primarily for reference, and many of our comments on it repeat material that is also found in earlier sections. But no documentation, however thorough, can cover every question that comes up and many can be answered quickly by consulting the code. On a first reading, we suggest that you read only the general documentation in sections I and following, unless you are particularly interested in the innards of reledmac.

1.2 History

1.2.1 edmac

The original version of edmac was TEXED.TEX, written by John Lavagnino in late 1987 and early 1988 for formatting critical editions of English plays.

John passed these macros on to Dominik Wujastyk who, in September–October 1988, added the footnote paragraphing mechanism, margin swapping and other changes to suit his own purposes, making the style more like that traditionally used for classical texts in Latin and Greek (e.g., the Oxford Classical Texts series). He also wrote some extra documentation and sent the files out to several people. This version of the macros was the first to be called edmac.

The present version was developed in the summer of 1990, with the intent of adding necessary features, streamlining and documenting the code, and further generalizing it to make it easily adaptable to the needs of editors in different disciplines. John did most of the general reworking and documentation, with the financial assistance of the Division of the Humanities and Social Sciences, California Institute of Technology. Dominik adapted the code to the conventions of Frank Mittelbach’s \texttt{doc} option, and added some documentation, multiple-column footnotes, cross-references, and crop marks\footnote{This version of the macros was used to format the Sanskrit text in volume I of \textit{Metarules of P\'an.\'inian Grammar} by Dominik Wujastyk (Groningen: Forsten, 1993).} A description by John and Dominik of this version of edmac was published as ‘An overview of edmac: a Plain \TeX\ format for critical editions’, \textit{TUGboat} 11 (1990), pp. 623–643.

From 1991 through 1994, the macros continued to evolve, and were tested at a number of sites. We are very grateful to all the members of the (now defunct) edmac@mailbase.ac.uk discussion group who helped us with smoothing out the bugs and infelicities in the macros. Ron Whitney and our anonymous reviewer at the TUG were both of great help in ironing out last-minute wrinkles, while Ron made some important suggestions which may help to make future versions of edmac even more efficient. Wayne Sullivan, in particular, provided several important fixes and contributions, including adapting the Mittelbach/Schöpf ‘New Font Selection Scheme’ for use with
PLAIN TeX and edmac. Another project Wayne has worked on is a DVI post-processor which works with an edmac that has been slightly modified to output \specials. This combination enables you to recover to some extent the text of each line as ASCII code, facilitating the creation of concordances, an index verborum, etc.

As of 1994, we were pleased to be able to say that edmac was being used for the real-life book production of several interesting editions, such as the Latin texts of Euclid’s Elements, an edition of the letters of Nicolaus Copernicus, Simon Breton’s Arithmetic, a Latin translation by Plato of Tivoli of an Arabic astrological text, a Latin translation of part II of the Arabic Algebra by Abū Kāmil Shujā’ b. Aslam, the Latin Rithmachia of Werinher von Tegernsee, a middle-Dutch romance epic on the Crusades, a seventeenth-century Hungarian politico-philosophical tract, an anonymous Latin compilation from Hungary entitled Sermones Compilati in Studio Generali Quinqueeclesiensi in Regno Ungarici, the collected letters and papers of Leibniz, Theodosius’s Spherics, the German Algorismus of Sacrobosco, the Sanskrit text of the Kāśikāvṛtti of Vāmana and Jayāditya, and the English texts of Thomas Middleton’s collected works.

1.2.2 ledmac

Version 1.0 of tabmac was released by Herbert Breger in October 1996. This added the capability for typesetting tabular material.

Version 0.01 of edstanza was released by Wayne Sullivan in June 1992, to help a colleague with typesetting Irish verse.

In March 2003 Peter Wilson started an attempt to port edmac from TeX to LaTeX. The starting point was edmac version 3.16 as documented on 19 July 1994 (available from CTAN). In August 2003 the tabmac functions were added; the starting point for these being version 1.0 of Ocober 1996. The edstanza (v0.01) functions were added in February 2004. Sidenotes and regular footnotes in numbered text were added in April 2004. This port was called ledmac (EPiX edmac).

Since July 2011, ledmac is maintained by Maïeul Rouquette. It is increasingly powerful and flexible, but it has also become increasingly divergent from the original TeX macro.

12Being prepared at Poona and Lausanne Universities.
1.3 Bibliography

1.2.3 eledmac

Important changes were put in version 1.0, to make \texttt{ledmac} more easily extensible (see \texttt{[7 p. 43]}. These changes can trigger small problems with the old customization. That is why a new name was selected: \texttt{eledmac} (extended \texttt{ledmac}).

To migrate from \texttt{ledmac} to \texttt{eledmac}, please read \texttt{[A.2 p. 394]}. 

1.2.4 reledmac

\texttt{eledmac} has facilitated the creation of customized critical editions. However, the changes made to allow such customization were made in a non-systematic way. Many deprecated commands were kept and many technical 'debts' were accumulated, hindering the future evolution of the package.

For these reasons, Maïeul Rouquette decided on a spring cleaning of the code. As some commands name were changed, the resulting compatibility was broken (a little).

A new name was selected: \texttt{reledmac} (extended renewed \texttt{eledmac}). To migrate from \texttt{eledmac} to \texttt{reledmac}, please read \texttt{[A.9 p. 397]}. 

1.3 Bibliography

A collaborative list of works edited with \texttt{(r)(e)ledmac} is available at \url{https://www.zotero.org/groups/209265/critical_editions_typeset_with_edmac_ledmac_eledmac_and_reledmac/}. Please add your own edition made with \texttt{(r)(e)ledmac}.

If you write a book or an article about \texttt{(r)(e)ledmac}, please add it on the collaborative bibliography on \url{https://www.zotero.org/groups/1024519/}.

2 How the package works — the problem of the number of \LaTeX\ runs

The \texttt{reledmac} package is a three-pass package like \LaTeX\ itself. Although your textual apparatus and line numbers will be printed on the first run, it takes two more compilations by \LaTeX\ to be sure that everything is correctly placed, and one more if you typeset right-to-left text with \texttt{Xe\LaTeX}. If you make any subsequent changes altering the number of lines or notes, the input file may similarly require three passes to get everything to the right place. \texttt{reledmac} will tell you that you need to make more runs when it detects changes, but it does not expend the labor to check this thoroughly. If you have problems with a line or two misnumbered at the top of a page, try running \LaTeX\ once or twice more.

However, the best way to be sure that one has made the right number of runs is to use some of \LaTeX's run scripts like \texttt{latexmk}.

3 Compatibility warning

If you use other classes than \texttt{\article} or \texttt{\book}, or modify the layout with \texttt{geometry}, some settings should be made to have correct height for the blocks of notes.
Please read 7.12.6 p. 55.
If you use the LuaTEX engine, you need LuaTEX 1.1.0 or later. A file may mix numbered and unnumbered text.

Numbered text is printed with marginal line numbers and can include footnotes and endnotes that are referenced to those line numbers: this is how you will want to print the text that you are editing.

Unnumbered text is not printed with line numbers, and you can’t use reledmac’s note commands with it: this is appropriate for introductions and other material added by the editor around the edited text.

4 Options

The package can be loaded with a number of global options which are listed here. There are two types of options: 1) options which provide specific features, and, 2) options which optimize the package’s performance. It is advisable for you to read the relevant parts of the handbook, before reading about the first type of option (specific features), but you can look at the second type (package optimization) in your first reading of the manual.

4.1 Specific features

draft  underlines lemmas in the main text.

auxdir  reledmac generates auxiliary files. It could be useful to store them in a specific directory. You can set it using auxdir=⟨folder⟩ option. Note the two following point:

1. TeX is not able to create folder. You should create it yourself.
2. The option does not change the default LATEX auxiliary files (.aux, .toc, …).

eledmac-compat  help to migrate from eledmac to reledmac (see A.9.5 p. 398).

nopenalties  must be called in some cases when using paragraphed endnotes (?? p. ??)

nopbinverse  prevents page break within verse environment.

noquotation  by default, the quotation environment is redefined within numbered text. You can disable this redefinition with noquotation (see 17 p. 76).

noresetlinenumannotation  Does not reset the annotations to line number at each line. See 5.5 p. 25

parapparatus  by default, the apparatus cannot contain paragraph breaks; this option enables paragraphing inside the apparatus.

swcaseinsensitive  make \sameword command case insensitive.
widthliketwocolumns set the width of the text printed in a single column to be the same as the width of the text printed in two parallel columns with \reledpar. This is useful when alternating between normal and parallel typesetting.

xindy and xindy+hyperref select xindy as the index processor (13.5 p. 70).

4.2 Optimizing package performance

nocritical disables tools for critical footnotes (\Afootnote, \Bfootnote etc.). If you do not need critical footnotes, this option lets \reledmac run faster. It will also preserve room for other packages.

noeledsec disables tools for \eledsection and related commands (16.2 p. 75).

noend disables tools for endnotes (\Aendnote, \Bendnote etc.). If you do not need endnotes, this option lets \reledmac run faster. It will also preserve room for other packages.

nofamiliar disables tools for familiar footnotes (\footnoteA, \footnoteB etc.). If you do not need familiar footnotes, this option lets \reledmac run faster. It will also preserve room for other packages.

noledgroup \reledmac allows use of a series of critical notes and a new series of normal notes inside minipage and ledgroup environments (see 10 p. 61). However, such features use up computer memory, at the expense of other processing needs. So if you do not need this feature, use noledgroup option. This should make \reledmac faster.

series \reledmac defines five levels of notes: A, B, C, D, E. Using all these levels consumes memory space and processing speed. This is why, if your work does not require the entire A–E series, you can narrow down the available number of series. For example, if you only need A and B series, call the package with series={A,B} option.

5 Text lines and paragraphs numbering

5.1 Text lines numbering

Each section of numbered text must be preceded by \beginnumbering and followed by \endnumbering, as in the following example.

\beginnumbering
  Text
\endnumbering

The \beginnumbering macro resets the line number to zero, reads an auxiliary file called ⟨jobname⟩.nn (where ⟨jobname⟩ is the name of the main input file for this job, and nn is 1 for the first numbered section, 2 for the second section, and so on), and then creates a new version of this auxiliary file to collect information during this run. The
first instance of \beginnumbering also opens a file called \jobname.<series>end to receive the text of the endnotes. \endnumbering closes the \jobname.nn file.

If the line numbering of a text is to be continuous from start to end, then the whole text will be typed between one pair of \beginnumbering and \endnumbering commands. But your text will most often contain chapter or other divisions marking sections that should be independently numbered, and these will be appropriate places to begin new numbered sections.

\reledmac has to read and store in memory a certain amount of information about the entire section when it encounters a \beginnumbering command, so it speeds up the processing and reduces memory use when a text is divided into a larger number of sections (at the expense of multiplying the number of external files that are generated).

5.2 Paragraphs

5.2.1 Basics

Within a numbered section, each paragraph of numbered text must be marked using the \pstart and \pend commands like this:

\pstart
Paragraph of text.
\pend

Text that appears within a numbered section but is not marked with \pstart and \pend will not be numbered.

The following example shows the proper section and paragraph markup and the kind of output that would typically be generated:

\beginnumbering
\pstart
This is a sample paragraph, with lines numbered automatically.
\pend

\pstart
This paragraph too has its lines automatically numbered.
\pend

The lines of this paragraph are not numbered.

\pstart
And here the numbering begins again.
\pend
\endnumbering
5.2 Paragraphs

5.2.2 Automatically producing \pstart ... \pend

You can use \autopar to avoid the nuisance of this paragraph markup and still have every paragraph automatically numbered. The \autopar command needs to be called inside a \beginnumbering...\endnumbering structure, as follows:
\beginnumbering
\ autopar

A paragraph of numbered text.

Another paragraph of numbered text.
\endnumbering

\autopar fails, however, on paragraphs that start with a \{ or with any other command that starts a new group before it generates any text. Such paragraphs need to be started explicitly, before the new group is opened, using \indent, \noindent, or \leavevmode, or using \pstart itself\[13\]

5.2.3 Content before specific \pstart and after specific \pend

Both \pstart and \pend can take an optional argument in brackets. Its content will be printed before the beginning of \pstart / after the end of \pend instead of the argument of \AtEveryPstart / \AtEveryPend.

Note that a \noindent will be automatically added before this argument, and, consequently, a \parskip will be inserted. You can use a second optional argument in brackets to avoid that \noindent.

\pstart[foo] % A \noindent will be inserted before foo.
\pstart[][foo] % No \noindent before foo.

The second optional argument of \pstart / \pend replaces the argument of \AtEveryPstart* / \AtEveryPend*.

If you need to start a \pstart with brackets, or to add brackets after a \pend, just add a \relax between \pstart...\pend and the brackets.

This feature is also useful when typesetting verses (see 9 p. 57) or reledpar (see 19.2 p. 80).

A \noindent is automatically added before this argument.

5.2.4 Content before every \pstart and after every \pend

\AtEveryPstart \AtEveryPend

You can use both \AtEveryPstart and \AtEveryPend. Their arguments will be printed before every \pstart begins / after every \pend ends.

Note that a `\noindent` will be inserted before the argument, and, consequently, a `\parskip`. You can use the starred version of `\AtEveryPstart` and `\AtEveryPend` to avoid the `\noindent`.

The argument of `\AtStartEveryPstart` / `\AtEndEveryPend` will be inserted at the beginning / the end of every `\pstart` / `\pend` in the same paragraph. For example, if you want each `\pstart` to start with a star, you can use:

\begin{verbatim}
\AtStartEveryPstart{*}
\end{verbatim}

Instead of manually doing

\begin{verbatim}
\pstart * Real pstart content.\pend
\end{verbatim}

### 5.2.5 Numbering paragraphs (\pstart)

It is possible to insert a number at every `\pstart` command; you must use the `\numberpstarttrue` command to have it. You can stop the numbering with `\numberpstartfalse`. You can redefine the command `\thepstart` to change style. You can change the value of the pstart number by using after `\beginnumbering`:

\begin{verbatim}
\setcounter{pstart}{value}
\end{verbatim}

On each `\beginnumbering` the numbering restarts.

With the `\sidepstartnumtrue` command, the number of `\pstart` will be printed at the sides of the text. In this case, the line number will be not printed.

With the `\labelpstarttrue` command, a `\label` added just after a `\pstart` will refer to the number of this pstart.

### 5.2.6 Languages written in Right to Left

If you use languages written right to left with Lua\TeX{} or Xe\TeX{}, you must switch text direction before the `\pstart` command.

### 5.2.7 Memory limits

This paragraph is kept for history, but the problems described below should not appear with the most recent version of \TeX{}.

`reledmac` stores a lot of information about line numbers and footnotes in memory as it goes through a numbered section. But at the end of such a section, it empties its memory out, so to speak. If your text has a very long numbered section it is possible that your \TeX{} may reach its memory limit. There are two solutions to this.

The first solution is to get a larger \TeX{} with increased memory. The second solution is to split your long section into several smaller ones. The trouble with this is that your line numbering will start again at zero with each new section. To avoid this problem, we provide `\pausenumbering` and `\resumenumbering` which are just like `\endnumbering ... \beginnumbering`, except that they arrange for
5.3 Lineation commands

5.3.1 Disabling lineation

\numberlinefalse Line numbering can be disabled with \numberlinefalse. It can be enabled again with \numberlinetrue.

This feature must be used with caution.

- It should not be used if you have critical footnotes after \numberlinefalse.

- It could be used in the following cases:
  - You want only familiar footnotes, not critical footnotes;
  - You want only parallel typesetting (using reledpar) but no critical footnotes.
  - You disable, for a portion of text, line numbering

- It must not be used if:
  - You do not want to have the line number in the margins, but do want to use critical footnotes. In this case, set \firstlinenum to a big value, such as 100,000 [5.4.2 p. 23].
  - You want to freeze the line numbering for some line, but still keep critical footnotes. In this case, use \startlock [5.4.2 p. 23].

A successor to reledmac may disable this feature.
5.3.2 Setting lineation start and step

By default, reledmac numbers every 5th line. There are two counters that control this behaviour: \firstlinenum and \linenumincrement. \firstlinenum specifies the first line that will have a printed number, and \linenumincrement is the difference between successive numbered lines. For example, to start printing numbers at the first line and to have every other line numbered:

\firstlinenum{1} \linenumincrement{2}

There are similar commands, \firstsublinenum{\langle num\rangle} and \sublinenumincrement{\langle num\rangle} for controlling sub-line numbering.

You can define \linenumberlist to specify a non-uniform distribution of printed line numbers. For example:

\gdef\linenumberlist{1,2,3,5,7,11,13,17,19,23,29}

to have numbers printed on prime-numbered lines only. There must be no spaces within the definition which consists of comma-separated integer numbers. The numbers can be in any order but it is easier to read if you put them in numerical order. Either omitting the definition of \linenumberlist or following the empty definition

\gdef\linenumberlist{}

the standard numbering sequence is applied. The standard sequence is that specified by the combination of the \firstlinenum, \linenumincrement, \firstsublinenum and \sublinenumincrement counter values.

5.3.3 Setting lineation reset

\lineation

Lines can be numbered either by page, by pstart or by section; you specify this using the \lineation{\langle arg\rangle} macro, where \langle arg\rangle is either page, pstart or section.

You may only use this command at places where numbering is not in effect; you can't change the lineation system within a section. You can change it between sections: they don't all have to use the same lineation system. The package's standard setting is \lineation{section}. If the lineation is by pstart, the pstart number will be printed before the line number in the notes.

5.3.4 Setting line number margin

\linenummargin

The command \linenummargin{\langle location\rangle} specifies the margin where the line (or pstart) numbers will be printed. The permissible values for \langle location\rangle are left, right, inner, or outer: for example, \linenummargin{inner}. The package's default setting is \linenummargin{left}

to typeset the numbers in the left hand margin. You can change this whenever you're not in the middle of making a paragraph.

More precisely, the value of \linenummargin used is the value in effect at the \pend of a numbered paragraph. Apart from an initial setting for \linenummargin, only change \linenummargin after a \pend, whereupon it will apply to all following numbered paragraphs, until changed again (changing it between a pstart and \pend pair will apply the change to all of the current paragraph).
5.4 Changing the line numbers

Normally, line numbering starts at 1 for the first line of a section and increments by one for each line thereafter. There are various common modifications of this system and the commands described here allow you to put such modifications into effect.

### 5.4.1 Sublineation

You insert the `\startsub` and `\endsub` commands in your text to turn sub-lineation on and off. For example, stage directions in plays are often numbered with sub-line numbers: as line 10.1, 10.2, 10.3, rather than as 11, 12, and 13. Titles and headings are sometimes numbered with sub-line numbers as well.

When sub-lineation is in effect, the line number counter is frozen and the sub-line counter advances instead. If one of these commands appears in the middle of a line, it doesn’t take effect until the next line; in other words, a line is counted as a line or sub-line depending on what it started out as, even if it changes in the middle.

You can change the separator between the line number and the sub-line number either by using `\Xsublinesep` without any optional argument (7.2.10 p. 47) or by using `\Xsublinesepside`. In the second case, it will change the separator only for line numbers in the margins, not in the footnotes.

### 5.4.2 Locking lineation

The `\startlock` command, used in running text, locks the line number at its current value, until you insert `\endlock`. It can tell for itself whether you are in a patch of line or sub-line numbering. One use for line-number locking is in printing poetry: there the line numbers should be those of verse lines rather than of printed lines, even when a verse line requires several printed lines. But in this case you may use the `\stanza` mechanism, see 9 p. 57.

When line-number locking is in effect, several printed lines may have the same line number, and you have to specify whether you want the number attached to the first printed line or the last, or whether you just want the number printed by them all, assuming that the settings of the previous parameters requires the display of a line number for this line. You specify your preference using `\lockdisp{arg}`; its argument is a word, either first, last, or all. The package initially sets this as `\lockdisp{first}`.

### 5.4.3 Setting and changing line number

In some cases you may want to modify the line numbers that are automatically cal-
culated: if you are printing only fragments of a work but want to print line numbers appropriate to a complete version, for example. The \setline{⟨num⟩} and \advanceline{⟨num⟩} commands may be used to change the current line’s number (or the sub-line number, if sub-lineation is currently on). They change both the marginal line numbers and the line numbers passed to the notes. \setline takes one argument, the value to which you want the line number set; it must be 0 or greater. \advanceline takes one argument, an amount that should be added to the current line number; it may be positive or negative.

5.4.4 Line number style

\linenumberstyle \sublinenumberstyle Line numbers are normally printed as arabic numbers. You can use \linenumberstyle{⟨style⟩} to change the numbering style. ⟨style⟩ must be one of:

Alph Uppercase letters (A…Z).
alph Lowercase letters (a…z).
arabic Arabic numerals (1, 2, …)
Roman Uppercase Roman numerals (I, II, …)
roman Lowercase Roman numerals (i, ii, …)

Note that with the Alph or alph styles, ‘numbers’ must be between 1 and 26 inclusive. Similarly \sublinenumberstyle{⟨style⟩} can be used to change the numbering style of sub-line numbers, which is normally arabic numerals.

5.4.5 Skipping and hiding number

\skipnumbering When inserted into a numbered line the macro \skipnumbering causes the numbering of that particular line to be skipped; that is, the line number is unchanged and no line number will be printed. Note that if you use it in \stanza, you must call it at the beginning of the verse.

\hidenumbering When inserted into a numbered line, the macro \hidenumbering causes the number for that particular line to be hidden; namely, no line number will print. Note that if you use it in \stanza, you must call it at the beginning of the verse.

\hidenumberingonleftpage \hidenumberingonrightpage When inserted into a numbered line, \hidenumberingonleftpage is like hidenumbering, but is applied only on left page. \hidenumberingonrightpage is applied on right page. They can be useful if the position of the line number is depending of the position of the page, but the position of marginal note is fixed.
5.5 Adding annotations to line numbers

You may want to have two or more numbers associated with a line of text. Consider, for example, the following cases:

- You want to split a line of verse into two parts depending upon some stylistic / rhythmic / linguistic convention.
- You want to add the line number used by a previous edition of the work.
- You want to typeset biblical text, and use division in verse.

In such instances, you must add the second number manually, as \texttt{relmac} can't determine a general pattern for such numbering, which depends too heavily upon the edited text\footnote{However, you may create your own commands dealing with such patterns which will in turn call \texttt{relmac} commands.}

To resolve this issue, \texttt{relmac} allows you to annotate line numbers using the following command:

\begin{verbatim}
\linenumannotation{<annotation>}
\end{verbatim}

The annotation can contain any textual value (whether number, text, or other) such as the line number from the older edition. Here are some characteristics of line number annotation:

- An annotation is associated with a line of text. It is reset with each new line of text, unless you use the \texttt{noresetlinenumannotation} option of \texttt{relmac}.
- It is printed alongside the line number in the margin.
- It is printed following the line number in critical footnotes and endnotes.
- And of particular interest: the annotation is printed in the critical note only when the \texttt{edtext} is issued after the \texttt{linenumannotation}.
- If two or more annotations are called before an \texttt{edtext}, the last one is used in associated notes.
- If an annotation is called within an \texttt{edtext}, it is printed as an annotation for the end of the lemma.

Here is an example, supposing we are on line 1:

\begin{verbatim}
\edtext{first lemma}
\linenumannotation{A}
\edtext{second lemma}{...}
\edtext{third}
   \linenumannotation{B}
   lemma}{...}
\edtext{fourth lemma}&
\end{verbatim}
In the critical notes, the line number will be followed

- by nothing in the first lemma, as there is no annotation for this line;
- by "A" for the second lemma;
- by "A-B" for the third lemma, as it starts while annotation A is still in effect and it finishes after annotation B has already taken effect;
- by "B" for the fourth lemma.

5.5.1 Modifying annotation associated with a specific note

The \texttt{\lineannot} macro changes the line number passed to a note. The \texttt{\lineannot} macro does the same for the annotations. It takes one argument, containing the beginning and ending annotations separated by a pipe (\texttt{|}). As with \texttt{\linenum}, if one wishes to change some specific part of the annotation, one can use

\begin{itemize}
  \item \texttt{\lineannot{\empty}}% to delete the beginning annotation
  \item \texttt{\lineannot{a}}% to change the beginning annotation
  \item \texttt{\lineannot{a|b}}% to change both
  \item \texttt{\lineannot{b}}% to change the ending annotation
\end{itemize}

5.5.2 Changing the position of the annotation

By default, annotations are placed after line numbers in both margin and footnote. To change this behaviour, one can use one of the following commands:

\begin{itemize}
  \item \texttt{\Xlinenumannotationposition\{⟨s⟩\}\{⟨v⟩\}} changes the position in critical footnotes with ⟨s⟩ for the series of footnotes to which it applies, where ⟨s⟩ may be a comma-separated list of series. When ⟨s⟩ is empty, the change applies also to annotations at the sides of the page, alongside the line number.
  \item \texttt{\Xlinenumannotationpositionside\{⟨v⟩\}} changes the position at the sides of the page, alongside the line numbers.
\end{itemize}

Note that \texttt{\Xlinenumannotationposition} without any optional argument will override this setting.

\begin{itemize}
  \item \texttt{\Xendlinenumannotationposition\{⟨s⟩\}\{⟨v⟩\}} changes the position in critical endnotes, ⟨s⟩ for the series of endnotes to which it applies, where ⟨s⟩ may once again be a comma-separated list of series.
\end{itemize}

In each of these three commands, ⟨v⟩ can be \texttt{after} or \texttt{before} to indicate position with regards to the line number.
5.5 Adding annotations to line numbers

5.5.3 Changing the macro in which annotations are wrapped

By default, annotations are wrapped in the \textsuperscript macro. You can modify this using one of the following:

- \Xwraplinenumannotation\{\langle s\rangle\}\{\langle cmd\rangle\} for critical footnotes; \langle s\rangle indicates the series of notes to which it applies and may be a comma-separated list of series. When \langle s\rangle is empty, the change applies to the annotations in the margins also—around the line number—as well as to the annotations referenced using the \annotationref command of the crossref mechanism \[11\] p. 62.

- \Xwraplinenumannotatiionside\{\langle cmd\rangle\} for annotations in the margins only. Note that \Xwraplinenumannotation without any optional argument will override this setting.

- \Xwraplinenumannotationref\{\langle cmd\rangle\} for annotations referenced using the \annotationref command of the crossref mechanism \[11\] p. 62. Note that \Xwraplinenumannotation without any optional argument will override this setting.

\langle cmd\rangle is a command which can take one argument; the backslash is required though.

For example, if you do not wish to have annotations in the margins, but do want to have them in bold in the critical footnotes and endnotes, you say\[^{19}\]

\makeatletter
\Xwraplinenumannotation\{\textbf\}
\Xendwraplinenumannotation\{\textbf\}
\Xwraplinenumannotatiionside\{\@gobble\}
\makeatother

5.5.4 Not printing the second identical annotations

If you print only line number annotation, you may get in critical notes something like 6–6, because the starting and ending annotations are the same. You can avoid that using \Xnoidenticalinenumannotation\{\langle s\rangle\} for critical footnotes or \Xendnoidenticalinenumannotation\{\langle s\rangle\}

5.5.5 Separator between annotations

If there an more than one annotation in the same line, there are separated by a comma. If you want to change the separator, you can use \setlinenumannotationsep\{\langle sep\rangle\}

\[^{19}\]The \@gobble command takes one argument, and returns nothing.
5.6 Executing code at each line

reledmac provides an advanced feature for users. The argument passed to \dolinehook{⟨arg⟩} will be executed before slicing a new line in the paragraph. The argument passed to \doinsidelinehook{⟨arg⟩} will be executed before printing a new line, when the line number has already been fixed. In many cases, the latter is more useful than the former. The file `examples/2-line_numbers_in_header.tex` provides an example for printing the first and last line numbers of a page in the header.

5.7 Executing code at a specific line

Sometime, you want to execute a code at a precise point in the flow of your text. For example, if the current header of the page corresponds to the position inside the text, you may want to use \markboth (or similar) command. The main problem is that you need to execute \markboth when reledmac typesets the text, and not when it reads it, because that could create damage with vertical spacing.

The \doinsidethislinehook{⟨code⟩} macro allows ⟨code⟩ to be executed when the text is typeset. The ⟨code⟩ will be executed in the line equivalent to the position of \doinsidethislinehook in the flow of the text.

For example, with the following code:

\begin{verbatim}
\beginnumbering
\pstart
...
1.\doinsidelinehook{\markboth{1}{1}} a
\pend
\end{verbatim}

\markboth{1}{1} will be executed at the line the 1. will be typeset. The ⟨code⟩ of \doinsidethislinehook will be executed only at the second run of \LaTeXX.

See the file `examples/2-subdivision-number-in-header.tex` for an example. Especially, the use of this command with \LaTeXX counters is quite complex, but the example show you how to deal with this problem.

6 Apparatus commands

6.1 Terminology

We call “critical notes” notes which refer to both a lemma, that is a part of text, and a line number. Critical notes are subdivided in critical footnotes and critical endnotes.

We call “familiar notes” notes which refer to a footnote mark in the main text. reledmac manages many series of notes of each category. A series of notes is identified by an uppercase letter. When the series letter is at the beginning of a command
name, it refers to a critical footnote. When the series letter is at the end of a command name, it refers to a familiar footnote.

So:

- \Afootnote is a critical footnote of the series A.
- \Bendnote is a critical endnote of the series B.
- \footnoteC is a familiar footnote of the series C.

6.2 Critical notes

6.2.1 The lemma

\edtext

Within numbered paragraphs, all footnotes and endnotes are generated by the \edtext macro:

\edtext{⟨lemma⟩}{⟨commands⟩}

The ⟨lemma⟩ argument is the lemma in the main text: \edtext both prints this as part of the text, and makes it available to the ⟨commands⟩ you specify to generate notes. For example:

I am happy: I saw my friend Smith on Tuesday.

The lemma Smith is printed as part of this sentence in the text, and is also made available to the footnote that specifies a variant, Jones C, D. The footnote macro is supplied with the line number at which the lemma appears in the main text.

The ⟨lemma⟩ may contain further \edtext commands. Nesting makes it possible to print an explanatory note on a long passage together with notes on variants for individual words within the passage. For example:

I am happy: I saw my friend Smith on Tuesday.

However, \edtext cannot handle overlapping but unnested notes—for example, one note covering lines 10–15, and another covering 12–18; an \edtext that starts in the ⟨lemma⟩ argument of another \edtext must end there, too. (The ⟨lemma⟩ and ⟨linenum⟩ commands may be used to generate overlapping notes if necessary.)

6.2.2 Footnotes

The second argument of the \edtext macro, ⟨commands⟩, may contain a series of subsidiary commands that generate various kinds of notes.
Apparatus commands

\Afootnote\Bfootnote\Cfootnote\Dfootnote\Efootnote

Five separate series of footnotes are maintained; each macro takes one argument like \Afootnote{⟨text⟩}. When all of the five are used, the A notes appear in a layer just below the main text, followed by the rest in turn, down to the E notes at the bottom. These are the main macros that you will use to construct the critical apparatus of your text.

If you need more series of critical notes, please look at 6.7.1 p. 41.

An optional argument can be added before the text of the footnote. Its value is a comma-separated list of options. The available options are:

- **fulllines** to disable \Xtwolines and \Xmorethantwolines features for this note (cf. 7.2.6 p. 46).
- **nonum** disables line numbering for this note. A horizontal blank space is added instead. You can use \Xinplaceofnumber to set it (7.2.14 p. 48).
- **nosep** to disable the lemma separator for this note. A horizontal blank space is added instead. You can use \Xendinplaceoflemmaseparator to set it (7.4.2 p. 50).
- **linerangesep=⟨c⟩** to change to ⟨c⟩ the separator between start line and end line for this particular note.

Example: \Afootnote[nonum]{⟨text⟩}.

6.2.3 Endnotes

\Aendnote\Bendnote\Cendnote\Dendnote\Eendnote

Inserting endnotes

The package also maintains five separate series of endnotes. If you do not need the endnotes facility, you should use noend option when loading reledmac.

The mechanism is similar to the one for footnotes: each macro takes one or more optional arguments and one single argument, like: \Aendnote[(option)]{⟨text⟩}.

(option) can contain a comma-separated list of values. Allowed values are:

- **fulllines** to disable \Xendtwolines and \Xendmorethantwolines features for this particular note (cf. 7.2.6 p. 46).
- **nonum** to disable line number for this particular note.
- **nosep** to disable the lemma separator for this particular note. A horizontal blank space is added instead. You can use \Xendinplaceoflemmaseparator to set it (7.4.2 p. 50).
- **linerangesep=⟨c⟩** to change to ⟨c⟩ the separator between start line and end line for this particular note.
6.2 Critical notes

\doendnotes

**Printing endnotes** Normally, endnotes are not printed: you must use the \doendnotes\{\(s\}\}, where \(s\) is the letter of the series to be printed. Put this command where you want the corresponding set of endnotes printed. In this case, all the endnotes of the \(s\) series are printed, for all numbered sections.

However, you may want to print the endnotes of one given series covering the first numbered section, then the endnotes of another given series covering the first numbered section, then the endnotes of the first given series covering the second numbered section, then the endnotes of the second given series covering the second numbered section, and so forth. In this case, use \doendnotesbysection\{\(s\}\}. For each value of \(s\), the first call of the command will print the notes for the first series, the second call will print the notes for the second series etc. For example, do:

\section{Endnotes}
\subsection{First text}
\doendnotesbysection{A}
\doendnotesbysection{B}
\subsection{Second text}
\doendnotesbysection{A}
\doendnotesbysection{B}

Note that by default inside endnotes no separator is used between the lemma and the content. However you can use the \Xendlemmaseparator macro to define one (7.4.2 p. 50).

As endnotes may be printed at any point in the document they always start with the page number where they are called.

\toendnotes \Xtoendnotes

**Code between endnotes** Sometimes, it is useful to insert content between endnotes of the same series: for example to separate endnotes of different sections of the same text. In this case, you could use inside numbered text the command: \toendnotes\{\(\text{series}\)\}\{\(\text{content}\)\} where \(\text{series}\) is a comma-separated list of the series of endnotes where \(\text{content}\) must be inserted. If \(\text{series}\) is empty, then \(\text{content}\) is inserted to all the series.

For example:

\toendnotes\{\section{Section’s title}\}

Alternatively, you can use \Xtoendnotes\{\(\text{content}\)\}, where “X” must be replaced by a series letter.

Remember that the endnotes are temporarily stored in an auxiliary file. That means in general you want to write the \(\text{content}\) in the auxiliary file without expanding it, that is without interpreting \TeX{} content.

However, in some cases, you may want to write a once-expanded\footnote{The expansion mechanism of \TeX{} is a quite complex problem, but fundamental. We have no place to explain it fully here. Read introduction to \TeX{} to understand well.} version of the \(\text{content}\), that is the version where the commands are expanded on the first level. This
Apparatus commands

6.2.4 Paragraph in critical apparatus

By default, no paragraph can be made in the notes of the critical apparatus. You can allow it by adding the options parapparatus when loading the package:

\usepackage[parapparatus]{eledmac}

Note that you cannot use paragraphs (e.g. blank lines or \par) inside of notes, when they are set to paragraph arrangement!

6.2.5 Change lemma and line number

\lemma

If you want to change the lemma that gets passed to the notes, you can do this by using \lemma\{alternative\} within the second argument to \edtext and before the note commands. The most common use of this command is to abbreviate the lemma that’s printed in the notes. For example:

I am happy:

\edtext{I saw my friend Smith}\{\Afootnote{Jones C, D.}\} on Tuesday.

You can use \linenum\{arg\} to change the line numbers passed to the notes. \{arg\} actually consist of seven parameters: the page, line, and sub-line number for the start of the lemma; the same three numbers for the end of the lemma; and the font specifier for the lemma. As the argument to \linenum, you specify those seven parameters in that order, separated by vertical bars (the | character). I.e.

\linenum\{start page|\{s. line\}|\{s. sub-l.\}|\{end p.\}|\{e. l.\}|\{e. sub-l.\}|\{font\}\}

However, you can retain the value computed by reledmac for any number by simply omitting it; and you can omit a sequence of vertical bars at the end of the argument. For example, \linenum\{||23\} changes only the ending page number of the current lemma.

This command does not change the marginal line numbers in any way; it just changes the numbers passed to the notes. Its use comes in situations that \edtext has trouble dealing with for whatever reason. If you need notes for overlapping passages that aren’t nested, for instance, you can use \lemma and \linenum to generate such notes despite the limitations of \edtext. If the \{lemma\} argument to \edtext is extremely long, you may run out of memory; here again you can specify a note with an abbreviated lemma using \lemma and \linenum. The numbers used in \linenum need
6.3 Disambiguation of identical words in the apparatus

Sometimes, the same word occurs twice (or more) in the same line. \reledmac provides tools to disambiguate references in the critical notes. The lemma will be followed by a reference number if a given word occurs more than once in the same line.

6.3.1 Basic use

To use this tool, you have to mark every occurrence of the potentially ambiguous term with the \sameword command:

Lupus \sameword{aut} canis \edtext{\sameword{aut}}{\Afootnote{et}} felix

In this example, aut will be followed, in the critical note, by the exponent 2 if it is printed in the same line as the first aut, but it will not if it is printed in a different line. The number is printed only after the second run.

\textsuperscript{17}We use \newcommand and \newcommandx instead of classical \let command because the edtabular environments have to modify the notes definition, and we need to use the newest definition of notes. Read the handbook of xargs to know more about \newcommandx.
6.3.2 Case setting

By default, `\sameword` is sensitive to the case. E.g. “foo” is considered as a different word to “Foo”.

You can use the `swcaseinsensitive` when loading the package to make `\sameword` insensitive to the case, i.e. to consider "foo" as identical "Foo".

6.3.3 Notes about input encoding with UTF-8 processor

If you use UTF-8 processor, like \textTeX or Lua\textTeX, there should not be any glitches. However, pay attention to how characters are encoded. Similar-looking characters may be represented differently in unicode numbering.

For instance, in French, “é” has two possible Unicode codepoints:

- LATIN SMALL LETTER E (U+0065) + COMBINING ACUTE ACCENT (U+0301)
- LATIN SMALL LETTER E WITH ACUTE (U+00E9)

Which unicode number you use depends, many times, on your keyboard configuration (the computer-input system).

Inside `reledmac`, the `\sameword` command considers these two unicodes (code points) as different characters. If you use only one unicode number consistently, the distinction will probably make no difference to how your text looks, but `\sameword` will process the text inaccurately, based on the unicode numbers. To prevent this, do the following:

- If you use X\textTeX, add this line in your preamble: \textTeXinputnormalization 1.
- If you use Lua\textTeX, use the `uninormalize` package of Michal Hofticht\footnote{https://github.com/michal-h21/uninormalize} with the `buffer` option set to true.

With these tools, X\textTeX / Lua\textTeX will dynamically normalize unicode input when reading the file. Consequently, you will have no problems with the `\sameword` command.

6.3.4 Notes about right-to-left texts

Due to some internal limits of X\textTeX, `\sameword` does not work with right-to-left text with this engine.

If you need to use `\sameword` with right-to-left text, you must use Lua\textTeX.

6.3.5 Use with `\lemma` command

If you use the `\lemma` command, `reledmac` cannot know to which occurrence of `\sameword` in the first argument of `\edtext` a word marked with `\sameword` in `\lemma` should refer.

For example, in the following example:
6.3 Disambiguation of identical words in the apparatus

```latex
\text{some thing}
\begin{verbatim}
   \text{\edtext{\sameword{sw}}}
   \text{and other \sameword{sw}}
   \text{and again \sameword{sw}}
   \text{it is all}}\%
   {\text{\lemma{\sameword{sw} \ldots all}\Afootnote{critical note}}}\%.
\end{verbatim}
```

reledmac cannot know if the “sw” in \texttt{\lemma} refers to the word after “thing”, after “other”, or after “again”.

Consequently, you must tell reledmac to which instance of \texttt{\sameword} you are referring in the first argument of \texttt{\edtext}:

- In the content of \texttt{\lemma}, use \texttt{\sameword} with no optional argument.
- In the first argument of \texttt{\edtext}, use \texttt{\sameword} with the optional argument \texttt{[⟨X⟩]}. \texttt{⟨X⟩} is the depth of the \texttt{\edtext} where the \texttt{\lemma} is used. So if the \texttt{\lemma} is called in a \texttt{\edtext} inside another \texttt{\edtext}, \texttt{⟨X⟩} is equal to 2. If the \texttt{\lemma} is called in a \texttt{\edtext} “of first level”, \texttt{⟨X⟩} is equal to 1. If the \texttt{\lemma} is called in both 1 and 2 \texttt{\edtext} depth, \texttt{⟨X⟩} is 1,2. If that word is referenced in the \texttt{\lemma} of every \texttt{\edtext} depth, \texttt{⟨X⟩} can also be set to \texttt{inlemma}.

Note that only words that are actually referenced in a \texttt{\lemma} need the optional argument. Therefore, the first \texttt{\sameword} in the example above should have “1” as its optional argument, to be referenced correctly in the \texttt{\lemma}.

Note also that the \texttt{⟨X⟩} does not refer to the level where the \texttt{\sameword} occurs, but to the level of the \texttt{\lemma} that refers to that \texttt{\sameword}. For example:

```latex
\begin{verbatim}
   \text{\edtext{\some \edtext{\sameword[1]{word}}\Afootnote{om. M}}}
   \text{and other \sameword{word}}
   \text{and again a \sameword{word}}
   \text{it is all}}\%
\end{verbatim}
```

Here the \texttt{\sameword} occurs in an \texttt{\edtext} of level 2, but since it is referenced by \texttt{\lemma} on level 1, it has “1” in the optional argument.

In the following example figure, each framed box represents an \texttt{\edtext} level. Each number is an occurrence of \texttt{\sameword}. After a framed box, the text in superscript represents the content of \texttt{\lemma} for that \texttt{\edtext} level. The text in subscript at the right of a number represents the content of the optional argument of \texttt{\sameword}.

```
1_{\text{inlemma}} 2 \cdots 3 4 \cdots 5
```

The \texttt{\sameword} number 3 is called in a \texttt{\lemma} related to an \texttt{\edtext} of level 2. It must be marked by “2”.

The \texttt{\sameword} number 5 is called in a \texttt{\lemma} related to \texttt{\edtext} of level 1. It must be marked by “1”.

The \texttt{\sameword} number 1 is called in two \texttt{\lemmas}: one related to a \texttt{\edtext} of level 1, the other related to \texttt{\edtext} of level 2. It must be marked by “1,2”. However, as \texttt{\lemma} is called only in level 1 and 2, “1,2” could replaced by “inlemma”.

```
The \texttt{\sameword} number 2 is in the first argument of a \texttt{\edtext} of level 3, but it has no \texttt{\lemma}-command, so there is no need to mark it.

Here, the corresponding code:

\begin{verbatim}
\edtext{\sameword[inlemma]{A}} (1)
\edtext{\sameword{A}} (2)
\sameword[2]{A} (3)
\lemma{\sameword{A} \ldots \sameword{A}} (4)
\sameword[1]{A} (5)
\end{verbatim}

\subsection{Sameword for a group of words}

Sometimes a group of words and not only a single word, occurs multiple times. In this case, you have two possibilities.

First, you can consider only the individual words, and not groups of word. For example:

\begin{verbatim}
\sameword{per} \sameword{causam}
tamen scire
\edtext{\sameword{causam}}{\Bfootnote{fnote}}
est
\edtext{\sameword{per} \sameword{causam}}{\Bfootnote{causam rei B}}
cognoscere
\edtext{\sameword{causam}}{\Bfootnote{fnote}}
\end{verbatim}

per causam tamen scire causam est per causam cognoscere causam

\begin{verbatim}
\end{verbatim}

\begin{verbatim}
\end{verbatim}
6.3 Disambiguation of identical words in the apparatus

In this case it is clear which "per causam" is meant. However, in the case that "per causam" is the lemma of the second note, there should be only one number for that whole lemma. In this case we can mark all "per causam" groups. But as "causam" is also called as lemma in note 1 and 3, we need to use nested \sameword commands. Consequently, we need to use \lemma for the \edtext linked to "per causam", as we don’t want to number each individual word.

\sameword{per \sameword{causam}} tamen scire
\edtext{\sameword{causam}} est
\edtext{\sameword{per \sameword{causam}}}{\lemma{\sameword{per causam}}\Bfootnote{causam rei B}}
\edtext{\sameword{causam}}\Bfootnote{fnote}

6.3.7 Customizing

You can redefine the \showwordrank macro to change the way the number is printed. The default value is

\newcommand{\showwordrank}[2]{% #1\textsuperscript{#2} %}

6.3.8 Problems with some macros

Macros inside \sameword that are not fully expandable, mainly macros which manipulate font features, write on full or have optional argument, may cause problems during compilation. Custom commands inside \sameword may therefore result in errors saying that “Use of sameword doesn’t match its definition.” To solve this, include a redefinition of your custom commands in the \svnoexpands macro. In order to not include any content of a macro during comparison, identify the command with \@gobble For example:

\makeatletter
\appto{\svnoexpands}{% \let\somemacro\@gobble %}
\makeatother
This will drop the content of \somemacro during comparison.

To include the content of the first and only one argument of a custom command in sameword comparison, use the \@firstofone command. For example, this is how \emph is handled:

\makeatletter
\appto{\swnoexpands}{%\let\emph\@firstofone%
}
\makeatother

To include command which can take optional argument, use \RenewExpandableDocumentCommand of \xparse. For example, this is how \edindex is handled:

\makeatletter
\appto{\swnoexpands}{%\RenewExpandableDocumentCommand{\edindex}{om}{}}%
\makeatother

6.3.9 Automatic sameword annotation

All potentially ambiguous apparatus entries must be annotated manually. That annotation process is laborious and includes a risk of errors. Samewords is a Python script that can automate this step of the process. It can be installed via the Python Package Index, but see [https://github.com/stenskjaer/samewords](https://github.com/stenskjaer/samewords) for more info and documentation. The script is still at a beta stage, so comments and questions as well as error reports are very welcome at [https://github.com/stenskjaer/samewords/issues](https://github.com/stenskjaer/samewords/issues).

Please note that the maintainer of this script is not identical with the maintainer of \reledmac.

6.4 Apparatus of manuscripts

The critical notes mostly refer to textual variants between manuscripts which contain the text to be edited. It may so happen that the manuscripts only contain parts of the text. Depending on one’s wishes, \reledmac can generate lists of relevant manuscripts for any delimited portion of text. Such lists are referred to as “apparatuses of manuscripts”.

To produce an apparatus of manuscripts with \reledmac, you have to insert specific commands that are used to mark the sections for which only part of the manuscripts are relevant. These commands will be processed, and after the second \LaTeX run, corresponding apparatuses of manuscripts will be inserted in the first (viz. ‘A’ series) level of footnotes.

As the insertion of this apparatus can change the page breaks, you may have to run \LaTeX two or more times. We strongly recommend to use tools like \latexmk to do that.
6.4 Apparatus of manuscripts

6.4.1 Marking sections of text

\texttt{\textbackslash msdata}{⟨text⟩} must be inserted at the point where a section for which only part of the manuscripts are relevant starts. ⟨text⟩ can be any arbitrary text, viz. a list of the manuscripts that are used for the section that starts. The command must be attached right at the point where the section starts, with no space, like so:

\texttt{\textbackslash msdata}{ABC}Lorem ipsum

Which means that the section of text starting by “Lorem ipsum” is witnessed by manuscripts A, B and C.

\texttt{\textbackslash stopmsdata} must be inserted at the point where the section of text previously marked by \texttt{\textbackslash msdata} ends. The command must be attached right to the end of the section, with no space. As \texttt{\textbackslash stopmsdata} is a \LaTeX{} argumentless macro, it will gobble the following space. To keep that space, you have to either append a backslash followed by a space or \{} \texttt{\textbackslash stopmsdata}, like so:

\texttt{\textbackslash msdata}{ABC}Lorem ipsum dolor
[...]
\texttt{\textbackslash stopmsdata}{\textbackslash \{}\texttt{\textbackslash msdata}{ABCD}sic transit [...]

Which means that the part of text containing “Lorem ipsum dolor [...] amet” is witnessed by manuscripts A, B and C, while the part of text starting “sic transit” is witnessed by manuscripts A, B, C and D.

\texttt{\textbackslash stopmsdata} is also automatically inserted by \texttt{\textbackslash msdata}.

Note that in most cases, any \texttt{\textbackslash stopmsdata} is followed by \texttt{\textbackslash msdata}. However, as these two command are usually separated by a space, it may happen that a line break be automatically inserted between them. This is why it is advised to always insert \texttt{\textbackslash stopmsdata}, even if \texttt{\textbackslash msdata} inserts it in case it is forgotten.

6.4.2 Layout of the apparatus of manuscripts

On every page, the apparatus of manuscripts marks the corresponding section with starting and ending line numbers. However, the following rules will be applied:

• If the section does not start on the current page, the starting line number will be the line number of the first line on the page.

• If the section does not stop on the current page, the ending line number will be the line number of the last line on the page.

• If the section neither starts nor ends on the current page, no line number will be printed. The same is true in case both \texttt{\textbackslash msdata} is called at the very beginning of the page and \texttt{\textbackslash endmsdata} is called at the very end of the page.
6.4.3 Settings

As the apparatus of manuscripts technically consists of first-level critical notes ('A' series), any setting available for critical notes can be applied [7]p. 159. However, the following additional commands are available.

\setmsdataseries 
The series used by default for the apparatus of manuscripts is series A. However, you can change it with \setmsdataseries{(series)}.

\setmsdatalabel 
As the apparatus of manuscripts consists of regular critical footnotes, a lemma is associated to them. By default, it is "Ms.". You can change it using \setmsdatalabel{(txt)}.

\setmsdataposition 
If you want the manuscript apparatus to be on the same level of critical footnotes as the other apparatuses, for each line, reledmac will first insert the manuscript apparatus, then the other footnotes. You can change it using:
\msdataposition{regular-msdata}
And restore the default behaviour using \msdataposition{msdata-regular}

6.5 Familiar notes

6.5.1 Basic use

\footnoteA \footnoteB \footnoteC \footnoteD \footnoteE 
As well as the standard \LaTeX footnotes generated via \footnote, the package also provides five series of additional footnotes called \footnoteA through \footnoteE. These have the familiar marker in the text, and the marked text at the foot of the page can be formatted using any of the styles described for the critical footnotes. Note that the ‘regular’ footnotes have the series letter at the end of the macro name whereas the critical footnotes have the series letter at the start of the name.

The footnote can take a first optional argument to manually define the footnote number or footnote symbol. For example:
\footnoteA[22]{This footnote will be numbered 22}

6.5.2 Customizing mark

\thefootnoteA \bodyfootmarkA \footfootmarkA 
Each series uses a set of macros for styling the marks. The mark numbering scheme of series A is defined by the \thefootnoteA macro; the default is:
\renewcommand*{\thefootnoteA}{\arabic{footnoteA}}
The appearance of the mark in the text is controlled by \bodyfootmarkA which is defined as:
\newcommand*{\bodyfootmarkA}{% 
  \hbox{\textsuperscript{\normalfont@nameuse{@thefnmarkA}}}}
The command \footfootmarkA controls the appearance of the mark at the start of the footnote text. It is defined as:
\newcommand*{\footfootmarkA}{\textsuperscript{\@nameuse{@thefnmarkA}}}
There are similar command triples for the other series.
6.6 Printing the footnote mark without printing the footnote text

6.5.3 Separator for multiple footnotes

The footmisc package [Fai03] by Robin Fairbairns has an option whereby sequential footnote marks in the text can be separated by commas like so. As a convenience reledmac provides this automatically.

\multfootsep

\multfootsep is used as the separator between footnote markers. Its default definition is:
\providecommand*{\multfootsep}{\textsuperscript{\normalfont,}}
and can be changed if necessary.

6.6 Printing the footnote mark without printing the footnote text

In certain cases, you can’t directly use \footnoteX; for example, when using \uline command of the ulem package. You need to print the footnote mark first, then call the footnote text to be inserted.

For all \(\langle X\rangle\) command, reledmac provides a \(\text{\footnote}(X)\)mark command and a \(\text{\footnote}(X)\)text command, equivalent to standard \LaTeX’s command \footnotemark and \footnotetext. For example, to use with \uline, do:

This is \uline{a test containing\mbox{\footnoteAmark}}\footnoteAtext{A simple footnote.}\uline{ a simple footnote.}

If you use reledpar, you can’t use these two commands to print the footnote mark on one side and the footnote text on the other side.

You must use \(\text{\footnote}(X)\)nomk and \(\text{\footnote}(X)\)mk, defined in reledpar (?? p. ??)

6.7 Changing series

6.7.1 Create a new series

If you need more than five series of critical footnotes, you can create extra series, using \newseries command. For example, to create F and G series \newseries{F,H}.

6.7.2 Delete series

As the number of series which are defined increases, reledmac gets slower. If you do not need all of the six standard series (A–E), you can load the package with the series option. For example, if you need only series A and B, use:

\usepackage[series={A,B}]{eledmac}

6.7.3 Series order

The default series order is the one called with the series option of the package, or, if this option is not used, A, B, C, D, E. Series order determines footnotes order.
However in some specific cases, you need to change the series order at some point inside the document. You can use `\seriesatbegin{⟨s⟩}` to pull up a given series ⟨s⟩ to the beginning, or `\seriesatend{⟨s⟩}` to push it down to the end.

### 6.8 Position of critical and familiar footnotes

There is a historical incoherence in \(r)(e)\ledmac. The familiar footnotes are before the critical footnotes in a normal page, but after in a minipage or in a ledgroup. However, it is possible to change the relative position of both types of footnotes. If you want to have familiar footnotes after critical footnotes in a normal page, use:

`\fnpos{critical-familiar}`

Or, if you want a minipage or ledgroup to have critical footnotes after familiar footnotes, use:

`\mpfnpos{familiar-critical}`

You can also decide to alternate familiar and critical footnotes with your own order. In this case, the second argument of `\fnpos` or `\mpfnpos` is a comma-separated list of values. Each value has the following form:

\[\langle series\rangle\langle type\rangle\]

⟨series⟩ is a series letter (A,B,C etc.), while ⟨type⟩ must be either “critical” or “familiar”.

For example, suppose you want to first print the familiar footnotes of the “A” series, then all the series of critical footnotes, and finally all the series of familiar footnotes, except the “A” series. In this case, use the following command:

```
\fnpos{%
  {A}{familiar},
  {A}{critical},% 
  {B}{critical},%
  {C}{critical},%
  {D}{critical},%
  {E}{critical},%
  {B}{familiar},%
  {C}{familiar},%
  {D}{familiar},%
  {E}{familiar}%
}
```

Note that you must define the position of all the series of footnotes you use. If you don’t, you will have infinite runs of \LaTeX.
7 Apparatus customization

Some commands can be used to change the display of the footnotes. All can have an optional argument \((s)\), which is the letter of the series — or a list of letters separated by comma — depending on which option is applied. If the optional argument is omitted or empty, the setting will apply to the entire series.

When a length, noted \(l\), is used, it can be stretchable: \(a \text{ plus } b \text{ minus } c\). The final length \(m\) is calculated by \LaTeX\ to have: \(a - c \leq m \leq a + b\). If you use some relative unit\(^{19}\) it will be relative to font size of the footnote, except for commands concerning the place kept by the notes — including blank space.

Some commands are boolean, indicating when an option is enabled. If you want to disable the option after enabling it, you must use \([\text{false}]\) as the second optional argument. For example:

- \(\text{\textbackslash XX}[A][\text{false}]\) to disable the ‘XX’ option for the series A.
- \(\text{\textbackslash XX}[][\text{false}]\) to disable it for all series.

There is also name convention:

- Names prefixed by \(X\) are for setting of critical footnotes.
- Names prefixed by \(Xend\) are for setting of critical endnotes.
- Names suffixed by \(X\) are for setting of familiar footnotes.

7.1 Notes arrangement in a series

By default, all footnotes are formatted as a series of separate paragraphs in one column. Three other formats are also available for notes.

Use \texttt{\textbackslash arrangement\{s\}\{a\}} to change the arrangement of the \(s\) series of critical footnotes and \texttt{\textbackslash arrangement\{X\}\{s\}\{a\}} to change the arrangement of the \(s\) series of familiar footnotes.

The value of \(a\) can be one of the following

- \texttt{paragraph} formats all of the footnotes of a series as a single paragraph; if you use this arrangement, you are strongly encouraged to read\(^{19.1.6} p. 79\)
- \texttt{twocol} formats them as separate paragraphs, but in two columns;
- \texttt{threecol}, in three columns.
- \texttt{normal}, restore normal arrangement.

You should set up the page layout parameters, and in particular the \texttt{\baselineskip} of the footnotes, before you call this macro because its action depends on these; too much or too little space will be allotted for the notes on the page if these macros use the wrong values.

\(^{19}\)Like \texttt{em} which is the width of an ’m’ in a given font.
Note that you cannot use paragraphs (e.g. blank lines or \par) or line breaks (\break or \linebreak or \newline etc.) inside of notes, when they are set to paragraph arrangement!

The notes arrangement must be called after having defined the document geometry setting. If you must change geometry setting inside your document, do not forget to call note arrangement again.

\hsize has been set for the pages that use this series of notes; otherwise \TeX{} will try to put too many or too few of these notes on each page. If you need to change the \hsize within the document, call the arrangement macro again afterwards to take account of the new value.

### 7.2 Control line number printing

#### 7.2.1 Print line number only at first time

\Xnumberonlyfirstinline

By default, the line number is printed inside every note. If you want to print it only the first time for a given line number (i.e., once for line 1, once for line 2, etc.), you can use \Xnumberonlyfirstinline[(s)].

\Xnumberonlyfirstintwolines

Suppose you have a lemma on line 2 and a lemma between line 2 and line 3. With \Xnumberonlyfirstinline, the second lemma is considered to be on the same line as the first lemma. But if you use both \Xnumberonlyfirstinline[(s)] and \Xnumberonlyfirstintwolines[(s)], a distinction is made.

\Xsymlinenum

For setting a particular symbol in place of the line number, you can use \Xsymlinenum[(s)]{(symbol)} in combination with \Xnumberonlyfirstinline[(s)]. From the second lemma of the same line, the symbol will be used instead of the line number. Note that any command called in \texttt{(symbol)} must be robust. Use \robustify to robustify a non-robust command.

\Xendnumberonlyfirstinline
\Xendnumberonlyfirstintwolines
\Xendsymlinenum

For endnotes, \Xendnumberonlyfirstinline; \Xendnumberonlyfirstintwolines and \Xendsymlinenum are the equivalents of \Xnumberonlyfirstinline; \Xnumberonlyfirstintwolines and \Xsymlinenum.

#### 7.2.2 Print line number annotation only the first time

\Xlinenumannotationonlyfirst

By default, the line number annotation (?? p. ??) is printed in every note. If you want to print it only the first time for a given annotation you can use \Xlinenumannotationonlyfirst[(s)].

Note the two following points:

- If you use the noresetлиненумannotation option of reledmac, the \Xlinenumannotationonlyfirst won’t take account of the official line number.

- The \Xlinenumannotationonlyfirst works for consecutive lemmas with the same annotation. That is, if you have for example a lemma with an \texttt{A} annotation, then a lemma with a \texttt{B} annotation, then a lemma with an \texttt{A} annotation, each lemma will have its own annotation in the apparatus.

\Xlinenumannotationonlyfirstintwo

Suppose you have a lemma on annotation 1 and a lemma between annotation 1 and annotation 3. With \Xlinenumannotationonlyfirst, the second lemma is considered to have the same annotation as the first lemma. But if you use both
7.2 Control line number printing

\Xlinenumannotationonlyfirst\[\langle s \rangle\] and \Xlinenumannotationonlyfirstintwo\[\langle s \rangle\], a distinction is made.

To use a particular symbol in place of the line number annotation, you can use \Xsymlinenumannotation\[\langle s \rangle\]{\langle symbol \rangle} in combination with \Xlinenumannotationonlyfirst\[\langle s \rangle\]. From the second lemma with the same line number annotation, the symbol will be used instead of the annotation. Note that any command called in \langle symbol \rangle must be robust. Use \robustify to robustify a non-robust command.

For endnotes, \Xendlinenumannotationonlyfirst; \Xendlinenumannotationonlyfirstintwo and \Xendsymlinenumannotation are the equivalents of \Xlinenumannotationonlyfirst; \Xlinenumannotationonlyfirstintwo and \Xsymlinenumannotation.

7.2.3 Print page number only at first time

For endnotes, reledmac provides a mechanism for printing the page number only the first time it is seen. However, when a lemma spans over two pages, the line numbers are normally printed in the following pattern: starting page number - starting line number - ending page number - ending line number. It follows that what corresponds to the actual 'page number' may not be self-evident. So: \Xendpagenumberonlyfirst\[\langle s \rangle\] can be called to ensure that the starting page number of a lemma be not printed if it is the same as the ending page number of the preceding lemma. You can use additionally one (and only one) of the following commands:

- \Xendpagenumberonlyfirstifsingle\[\langle s \rangle\]: the first page number of the lemma will not be printed only if the following conditions are true:
  1. The starting page number of the lemma is the same as the ending page number of the preceding lemma.
  2. The ending page number of the lemma is the same as the starting page number of the lemma.

In this case the ending page number will always be printed if it is different from the starting page number.

- \Xendpagenumberonlyfirstintwo\[\langle s \rangle\]: both the starting page number and the ending page number of a lemma are not printed if they are both the same as the starting page number and the ending page number of the preceding lemma respectively.

In any case, you can use:

- \Xendsympagenum\[\langle series \rangle\]{\langle c \rangle} to print \langle c \rangle when the page number is not printed.

- \Xendinplaceofpagenumber\[\langle series \rangle\]{\langle l \rangle} to print a \langle l \rangle length horizontal space in case no symbol is printed instead of the page number.
### 7.2.4 Arbitrary text before line number

\texttt{\textbackslash Xtxtbeforenumber} \texttt{\{\textbackslash (txt)\}} allows the insertion of \texttt{\{txt\}} before the line number only when the line number is printed, so taking into account \texttt{\textbackslash Xnumberonlyfirstinline} and the like.

\texttt{\textbackslash Xendbeforepagenumber} \texttt{\{\textbackslash (s)\}} defines the text before the page number in endnotes. Default value is \texttt{p} ("p" followed by a dot).  

\texttt{\textbackslash Xendafterpagenumber} \texttt{\{\textbackslash (s)\}} defines the text after the page number in endnotes. Default value is \texttt{\{\textbackslash (open parenthesis followed by a single space\}}. \texttt{\textbackslash Xendlineprefixsingle\{}\texttt{\{\textbackslash text\}\}} defines the text before the line number in endnotes when there is only one line. Default value is empty. \texttt{\textbackslash Xendlineprefixmore\{}\texttt{\{\textbackslash text\}\}} defines the text before the line number in endnotes when there is more than one line. Default value is empty. If you don’t define it, it will use the value defined by \texttt{\textbackslash Xendlineprefixsingle}.

### 7.2.5 Separator for line range

\texttt{\textbackslash Xlinerangeseparator} By default, the separator between the begin line and the end line in a lines’ range is an en-dash in a normal font \texttt{\{\textbackslash textnormal\{-\}-\}}). You can change it for critical footnotes with \texttt{\textbackslash Xlinerangeseparator\{}\texttt{\{\textbackslash (text\}}), and with \texttt{\textbackslash Xendlinerangeseparator\{}\texttt{\{\textbackslash (text\}} for critical endnotes.

### 7.2.6 Abbreviate line range

\texttt{\textbackslash Xtwolines} \texttt{\textbackslash Xmorethantwolines} If a lemma is printed on two subsequent lines, \texttt{reledmac} will print the first and the last line numbers. Instead of this, it is also possible to print an abbreviation which stands for “line 1 and subsequent line(s)”. To achieve this, use \texttt{\textbackslash Xtwolines\{}\texttt{\{\textbackslash text\}} and \texttt{\Xmorethantwolines\{}\texttt{\{\textbackslash text\}}. The \texttt{\{text\}} argument of \texttt{\Xtwolines} will be printed if the lemma is on two lines, and the \texttt{\{text\}} argument of \texttt{\Xmorethantwolines} will be printed if the lemma is on three or more lines. For example:

\begin{align*}
\texttt{\Xtwolines\{}\texttt{sq.}\}\text{ } \\
\texttt{\Xmorethantwolines\{}\texttt{sqq.}\}
\end{align*}

will print “1sq.” for a lemma which falls on lines 1–2 and “1sqq.” for a lemma which falls on lines 1–4.

If you use \texttt{\textbackslash Xtwolines} without setting \texttt{\textbackslash Xmorethantwolines}, the \texttt{\{text\}} argument of \texttt{\Xtwolines} will be used for lemmas which fall on three or more lines.

However, if you want to use a short form (when the lemma overlaps two lines, but not more than two), use \texttt{\textbackslash Xtwolinesbutnotmore\{}\texttt{\{\textbackslash series\}}.

When you use lineation by page, the final page number, if different from the initial page number, will not be printed, because the final page number is included in the \texttt{\endtwolines} symbol.

\texttt{\textbackslash Xtwolinesonlyinsamepage} However, you can force print the final page number with \texttt{\textbackslash Xtwolinesonlyinsamepage\{}\texttt{\{\textbackslash series\}}.
7.2  Control line number printing

You can disable \Xtwolines and related for a specific note by using the ‘[fulllines]’ argument in the note macro cf. 6.2.2 p. 30. For endnotes, use these macros: \Xendtwolines; \Xendmorethantwolines; \Xendtwolinesbutnotmore; \Xendtwolinesonlyinsamepage instead of \Xtwolines; \Xmorethantwolines; \Xtwolinesbutnotmore; \Xtwolinesonlyinsamepage.

7.2.7 Disable line number

\Xnonumber You can use \Xnonumber[⟨s⟩] if you do not want to have the line number in a footnote. \Xendnonumber[⟨s⟩] is the same for endnote.

7.2.8 Printing pstart number

\Xpstart You can use \Xpstart[⟨s⟩] if you want to print the pstart number in the footnote, before the line and subline number. Note that when you change the lineation system, the option is automatically switched:

- If you use lineation by pstart, the option is enabled.
- If you use lineation by section or by page, the option is disabled.

\Xpstarteverytime By default, the pstart number is printed only in the part of text where you have called \numberpstarttrue. We don’t know why you would like to print the pstart number in the notes and not in the main text. However, if you want to do it, you can call \Xpstarteverytime[⟨s⟩]. In this case, the pstart number will be printed every time in footnote.

\Xonlypstart In combination with \Xpstart, you can use \Xonlypstart[⟨s⟩] if you want to print only the pstart number in the footnote, and not the line and subline number.

7.2.9 Printing stanza number

\Xstanza You can use \Xstanza[⟨s⟩] if you want to print the stanza number in the footnote, before the line and subline number. Of course the stanza number is printed only when you use \numberstanza

\Xstanzaseparator When using \Xstanza, you can use \Xstanzaseparator[⟨s⟩]{⟨text⟩} to print ⟨text⟩ after the stanza number. Default value is empty.

7.2.10 Separator between line and subline numbers

\Xsublinesep \Xsublinesep[⟨s⟩]{⟨txt⟩} changes the separator between line and subline in footnotes.

Employed without optional argument, it also changes the separator in side numbering.

\Xendsublinesep \Xendsublinesep[⟨s⟩]{⟨txt⟩} does the same thing for endnotes.
However, it does not change anything for the separator in side numbering. Use \sublinesep without optional argument or \sublinesepsidetext to do it.

The default value is textnormal{.}.

7.2.11 Separator between page and line numbers

\pagelinesep \pagelinesep\{(s)\}\{txt\} changes the separator between the page and line number in footnotes.

By default, the value defined for \sublinesep is used.

7.2.12 Space around number

\beforenumber With \beforenumber\{(s)\}\{l\}, you can add some space before the line number in a footnote. If the line number is not printed, the space is not either. The default value is 0 pt.

\afternumber With \afternumber\{(s)\}\{l\} you can add some space after the line number in a footnote. If the line number is not printed, neither is the space. The default value is 0.5 em.

\endbeforenumber and \endafternumber are the equivalents of \beforenumber and \afternumber for endnotes.

\nonbreakableafternumber By default, the space defined by \afternumber is breakable. With \nonbreakableafternumber\{(s)\} it becomes nonbreakable.

7.2.13 Space around line symbol

\beforesymlinenum With \beforesymlinenum\{(s)\}\{l\} you can add some space before the line symbol in a footnote. The default value is value set by \beforenumber.

\aftersymlinenum With \aftersymlinenum\{(s)\}\{l\} you can add some space after the line symbol in a footnote. The default value is value set by \afternumber.

\endbeforesymlinenum and \endaftersymlinenum are the equivalents of \beforesymlinenum and \aftersymlinenum for the endnotes.

7.2.14 Space in place of number

\inplaceofnumber If no number or symbolic line number is printed, you can add a space, with \inplaceofnumber\{(s)\}\{l\}.

The default value is 1 em.

\endinplaceofnumber \inplaceofnumber\{(s)\}\{l\} is the same, for critical endnotes.

7.2.15 Boxing line number and line symbol

\boxlinenum It could be useful to put the line number inside a fixed box: the content of the note will be printed after this box. You can use \boxlinenum\{(s)\}\{l\} to do that. To subsequently disable this feature, use \boxlinenum with length equal to 0 pt. One use of this feature is to print line number in a column, and the note in an other column:

\hangindent{1em}
\afternumber{0em}
7.3 Arbitrary code around line number

\Xboxlinenum{1em}

\Xboxsymlinenum \Xboxsymlinenum[(s)]{(l)} is the same as \Xboxlinenum but for the line number symbol.
\Xendboxsymlinenum \Xendboxsymlinenum[(s)]{(l)} is the same as \Xboxsymlinenum but for endnotes.
\Xboxlinenumalign If you put line number in box, it will be aligned left inside the box. However, you can change it using \Xboxlinenumalign[(s)]{(text)} where (text) can be the following:
\textbf{L} to align left (default value);
\textbf{R} to align right;
\textbf{C} to center.

When using \Xboxlinenum, \reledmac put all the line number description in the same box. That is, the same box will contain: the start line number, the dash, and either the end line number or the range symbol (like \textit{ff.}). However, it is possible to box them in two different boxes.

- \Xboxstartlinenum[(s)]{(l)} will box the start line number in a box of length (l). The content will be put at the right of the box.
- \Xboxendlinenum[(s)]{(l)} will box the dash plus the end line number or the range symbol in a box of length (l). The content will be put at the left of the box.

With these two commands, it is possible to horizontally align the dash of line number when using critical notes, to obtain something like:

1  
12-23  
24ff.

\Xendboxlinenum \Xendboxlinenum[(s)]{(l)}, \Xendboxlinenumalign[(s)]{(text)}, \Xendboxstartlinenum[(s)]{(l)}, \Xendboxendlinenum[(s)]{(l)} are the same as, respectively, \Xboxlinenum and \Xboxlinenumalign, \Xboxstartlinenum, \Xboxendlinenum except in endnotes.

7.3 Arbitrary code around line number

\Xendhooklinenum \Xendhooklinenum[(s)]{(code)} is used to execute code before line numbers in endnotes. The code is executed before the \Xendbeforelinenum space and before the \Xendnotenumfont font setting.
\Xendahooklinenum \Xendahooklinenum[(s)]{(code)} is used to execute code after line number in endnotes. The code is executed after the \Xendafternumber space.
\Xendhookinplaceofnumber \Xendhookinplaceofnumber[(s)]{(code)} is used to execute code before space or symbol which replace line number in endnotes. The code is executed before the \Xendbeforesymlinenum space and before the \Xendnotenumfont font setting.
\Xendahookinplaceofnumber \Xendahookinplaceofnumber[(s)]{(code)} is used to execute code after space or symbol which replace line number in endnotes. The code is executed after the \Xendaftersymlinenum space.
7.4 Separator between the lemma and the note

7.4.1 For footnotes

\Xlemmaseparator By default, in a footnote, the separator between the lemma and the note is a right bracket \(\rbracket\). You can use \Xlemmaseparator\{⟨Xlemmaseparator⟩\} to change it. The optional argument can be used to specify the series in which it is used. Note that there is a non-breakable space between the lemma and the separator, but a \textbf{breakable} space between the separator and the following text.

\Xbeforelemmaseparator Using \Xbeforelemmaseparator\{⟨s⟩\}\{⟨l⟩\} you can add some space between lemma and separator. If your lemma separator is empty, this space won’t be printed. The default value is 0 em.

\Xafterlemmaseparator Using \Xafterlemmaseparator\{⟨s⟩\}\{⟨l⟩\} you can add some space between separator and note. If your lemma separator is empty, this space will not be printed. The default value is 0.5 em.

\Xnolemmaseparator You can suppress the lemma separator, using \Xnolemmaseparator\{⟨s⟩\}, which is simply a alias of \Xlemmaseparator\{⟨s⟩\}\{}.

\Xinplaceoflemmaseparator With \Xinplaceoflemmaseparator\{⟨s⟩\}\{⟨l⟩\} you can add a space if no lemma separator is printed. The default value is 1 em.

7.4.2 For endnotes

\Xendlemmaseparator By default, there is no separator inside endnotes between the lemma and the content of the note. You can use \Xendlemmaseparator\{⟨s⟩\}\{⟨l⟩\} to change this. The optional argument can be used to specify the series in which it is used. A common value of \{⟨Xendlemmaseparator⟩\} is \rbracket.

Note that there is a non-breakable space between the lemma and the separator, but a \textbf{breakable} space between the separator and the following text.

\Xendbeforelemmaseparator Using \Xendbeforelemmaseparator\{⟨s⟩\}\{⟨l⟩\} you can add some space between the lemma and the separator. If your lemma separator is empty, this space won’t be printed. The default value is 0 em.

\Xendafterlemmaseparator Using \Xendafterlemmaseparator\{⟨s⟩\}\{⟨l⟩\} you can add some space between the separator and the content of the note. If your lemma separator is empty, this space won’t be printed. The default value is 0.5 em.

\Xendinplaceoflemmaseparator With \Xendinplaceoflemmaseparator\{⟨s⟩\}\{⟨l⟩\} you can add some space if you choose to remove the lemma separator. The default value is 0.5 em.

7.5 Font style

7.5.1 For line number

\Xnotenumfont \Xnotenumfont\{⟨s⟩\}\{⟨command⟩\} is used to change the font style for line numbers in critical footnotes; \{⟨command⟩\} must be one (or more) switching command, like \bfseries.

\Xendnotenumfont \Xendnotenumfont\{⟨s⟩\}\{⟨command⟩\} is used to change the font style for line

\footnote{For polyglossia, when the lemma is RTL, the bracket automatically switches to a left bracket.}
7.6 Wrapping notes

7.6.1 Wrapping lemmas

\Xwraplemma \( \langle \text{cmd} \rangle \) is used to wrap, in the footnote, the lemma in a \LaTeX\ command. For example, with the bidi package, to ensure having a lemma written right to left, use \Xwraplemma\RL.

\Xwrappendlemma \( \langle \text{cmd} \rangle \) is the same for endnotes.

7.5.2 For the lemma

By default, font of the lemma in footnote is the same as font of the lemma in the main text. For example, if the lemma is in italic in the main text, it is also in italic in note. The \Xlemmadisablefontselection \( \langle \text{s} \rangle \) command allows to disable it for a specific series.

\Xlemmadisablefontselection

By default, font of the lemma in endnote is the same as font of the lemma in the main text. For example, if the lemma is in italic in the main text, it is also in italic in note. The \Xendlemmadisablefontselection \( \langle \text{s} \rangle \) command allows \Xendlemmadisablefontselection\( \langle \text{s} \rangle \) to disable it for a specific series.

\Xlemmadisablefontselection

Use \Xlemmafont \( \langle \text{s} \rangle \) \( \langle \text{cmd} \rangle \) to apply a \LaTeX\ font command to the lemma. For example, to have boldface lemma:

\Xlemmafont\bfseries

\Xendlemmafont

\Xendlemmafont\( \langle \text{s} \rangle \) \( \langle \text{cmd} \rangle \) is the same for endnotes.

7.5.3 For all notes

\Xnotefontsize \( \langle \text{s} \rangle \) \( \langle \text{cmd} \rangle \) is used to define the font size of critical footnotes of the series. The default value is \footnotesize. The \( \langle \text{cmd} \rangle \) must not be a size in pt, but a standard \LaTeX\ size, like \small.

\XnotefontsizeX \( \langle \text{s} \rangle \) \( \langle \text{cmd} \rangle \) is used to define the font size of familiar footnotes of the series. The default value is \footnotesize. The \( \langle \text{cmd} \rangle \) must not be a size in pt, but a standard \LaTeX\ size, like \small.

\Xendnotefontsize \( \langle \text{s} \rangle \) \( \langle \text{cmd} \rangle \) is used to define the font size of end critical footnotes of the series. The default value is \footnotesize. The \( \langle \text{cmd} \rangle \) must not be a size in pt, but a standard \LaTeX\ size, like \small.

7.6 Wrapping notes

7.6.1 Wrapping lemmas

\Xwraplemma \( \langle \text{cmd} \rangle \) is used to wrap, in the footnote, the lemma in a \LaTeX\ command. For example, with the bidi package, to ensure having a lemma written right to left, use \Xwraplemma\RL.

\Xwrappendlemma \( \langle \text{cmd} \rangle \) is the same for endnotes.
7.6.2 Wrapping contents

\textbackslash wrapcontent\{\langle cmd\rangle\} is used to wrap the footnote contents — excluding the lemma — in a \LaTeX\ command.

For example, if the language of your note is not the same as the language of the lemma, use \textbackslash wrapcontent\{foreignlanguage\{\langle language\rangle\}\} (with babel) or \textbackslash wrapcontent\{\text\{\langle language\rangle\}\} (for babel).

\textbackslash endwrapcontent\{\langle s\rangle\}\{\langle cmd\rangle\} is the same for endnotes.

\textbackslash wrapcontentX\{\langle s\rangle\}\{\langle cmd\rangle\} is the same for familiar footnotes.

7.7 Indent of notes content

\textbackslash parindent\, By default, \texttt{reledmac} does not add indentation before the paragraphs inside critical footnotes. Use \textbackslash parindent\{\langle s\rangle\} to enable indentation.

\textbackslash parindentX\, By default, \texttt{reledmac} does not add indentation before the paragraphs inside familiar footnotes. Use \textbackslash parindentX\{\langle s\rangle\} to enable indentation.

\textbackslash hangindent\, For critical notes NOT paragraphed you can define an indent with \textbackslash hangindent\{\langle s\rangle\}\{\langle l\rangle\}, which will be applied in the second line of notes. It can help to make distinction between a new note and a break in a note. The default value is 0 pt.

\textbackslash hangindentX\, For familiar notes NOT paragraphed you can define an indentation with \textbackslash hangindentX\{\langle s\rangle\}\{\langle l\rangle\}, which will be applied in the second line of notes. It can help to make a distinction between a new note and a break in a note.

\textbackslash endhangindent\, For critical endnotes NOT paragraphed you can define an indentation with \textbackslash endhangindent\{\langle s\rangle\}\{\langle l\rangle\}, which will be applied in the second line of notes. It can help to make a distinction between a new note and a break in a note.

7.8 Arbitrary code at the beginning of notes

The three next commands add arbitrary code at the beginning of notes. As the name’s space is local to the notes, you can use it to redefine some style inside the notes. For example, if you don’t want the pstart number to be in bold, use:

\textbackslash xbhooknote\{\renewcommand\{\thepstart\}\{\arabic\{pstart\}\}.\}\}

\textbackslash xbhooknote\\textbackslash xbhooknote\{\langle s\rangle\}\{\langle code\rangle\} is to be used at the beginning of each critical footnote.

\textbackslash bbhooknoteX\\textbackslash bbhooknoteX\{\langle s\rangle\}\{\langle code\rangle\} is to be used at the beginning of each familiar footnote.

\textbackslash endbbhooknote\\textbackslash endbbhooknote\{\langle s\rangle\}\{\langle code\rangle\} is to be used at the beginning of each endnote.

7.9 Arbitrary code before inserting note

\textbackslash beforeinserting\{\langle s\rangle\}\{\langle code\rangle\} and \textbackslash beforeinsertingX\{\langle s\rangle\}\{\langle code\rangle\} are very technical commands.

They allow one to add any arbitrary code just before the footnotes are added in the list of footnotes. The main use is to insert text direction code. For example, if you edit right-to-left text with \texttt{bidi}, but want your critical footnote be left-to-right, use \textbackslash beforeinserting\{\langle l\rangle\} \texttt{LTR}. You should also use \textbackslash wraplemma to ensure your lemmas are right-to-left in a left-to-right paragraph (7.6.1 p. 51).
Note that the changes are local to the footnote.

### 7.10 Options for footnotes in columns

#### 7.10.1 Alignment

*\texttt{\textbackslash colalignX}* By default, text in footnotes of two or three columns are flush left and without hyphenation. However, you can change this with `\texttt{\textbackslash colalignX[\langle s\rangle\{\langle code\rangle\}}` for critical footnotes, and `\texttt{\textbackslash colalignX[\langle s\rangle\{\langle code\rangle\}}` for familiar footnotes. 

`<\texttt{\textbackslash code}>` must be one of the following command:

- `\justifying` to have text justified, as usual with \TeX{}.
- `\raggedright` to have text left aligned, but *without hyphenation*. That is the default reledmac setting.
- `\RaggedRight` to have text left aligned *with hyphenation* (requires \ragged2e).
- `\raggedleft` to have text right aligned, but *without hyphenation*.
- `\RaggedLeft` to have text right aligned *with hyphenation* (requires \ragged2e).
- `\centering` to have text centered, but *without hyphenation*.
- `\Centering` to have text centered *with hyphenation* (requires \ragged2e).

#### 7.10.2 Size of the columns

For the following four macros, be careful that the columns are made from right to left.

- `\Xhsizetwocol` is used to change width of a column when critical notes are displaying in two columns. Default value is `.45 \texttt{\textbackslash hsize}`.
- `\Xhsizethreecol` is used to change width of a column when critical notes are displaying in three columns. Default value is `.3 \texttt{\textbackslash hsize}`.
- `\hsizetwocolX` is used to change width of a column when familiar notes are displaying in two columns. Default value is `.45 \texttt{\textbackslash hsize}`.
- `\hsizethreecolX` is used to change width of a column when familiar notes are displaying in three columns. Default value is `.3 \texttt{\textbackslash hsize}`.

### 7.11 Options for paragraphed footnotes and notes grouped by line

#### 7.11.1 Mark separation of notes

*\texttt{\textbackslash afternoteX}* You can add some horizontal space after a note by using `\texttt{\textbackslash afternote[\langle s\rangle\{\langle l\rangle\}}` (for critical footnotes) or `\texttt{\textbackslash afternoteX[\langle s\rangle\{\langle l\rangle\}}` (for familiar footnotes). The default value is `1em plus .4em minus .4em`.

*\texttt{\textbackslash parafootsepX}* For paragraphed footnotes (see below), you can choose the separator between each note by using `\texttt{\textbackslash parafootsep[\langle s\rangle\{\langle text\rangle\}}` for critical notes and `\texttt{\textbackslash parafootsepX[\langle s\rangle\{\langle text\rangle\}}` for familiar notes. A common separator is the double pipe (`||`), which you can set by using `\texttt{\textbackslash parafootsep\{$\parallel$\}}`.
Note that if the symbol defined by \symlinenum must be used at the beginning of a note, the \parafootsep is not used before this note.

7.11.2 Ragged text

\raggedtext

Text in paragraphed critical notes is justified, but you can use \raggedtext{(s)}[L] if you want it to be ragged left (i.e., right justified), or \raggedtext{(s)}[R] if you want it to be ragged right (i.e., left justified).

\textraggedtext

Text in paragraphed footnotes is justified, but you can use \textraggedtext{(s)}[L] if you want it to be ragged left, or \textraggedtext{(s)}[R] if you want it to be ragged right.

7.12 Options for block of notes

7.12.1 Grouping notes by line

\groupbyline

If you do not use \arrangement[paragraph], you may want to group all the critical footnotes related to the same line in the same paragraph. In this case, use \groupbyline[series].

In many cases, you might like to use it in combination with \numberonelastinline.

\groupbylineseparetwolines

Note that the \afternote and \parafootsep settings are used to determine space and content between footnotes. Suppose you have two notes on line 1 which overlap lines 1 and 2. This last note will be printed, if you use \groupbyline in the same group as the previous one. In the case you want that note to be distinct, you must use both \groupbyline and \groupbylineseparetwolines.

In many cases, you might like to use it in combination with \numberonelastintwolines.

7.12.2 Text before notes

\txtbeforenotes

You can add text before critical footnotes with \txtbeforenotes{(s)}{(text)}.

\txtbeforenotesX

You can add text before familiar footnotes with \txtbeforenotesX{(s)}{(text)}.

\xtxtbeforenotes

You can add text before endnotes with \xtxtbeforenotes{(s)}{(text)}. The text will be typeset only if there are endnotes.

By default, such texts are inserted at the beginning of the groups of notes on each page. You can add \txtbeforenotesonlyonce (for critical footnotes) and \txtbeforenotesonlyonceX (for familiar footnotes) to insert them only the first time notes are typeset.

7.12.3 Code before notes

\bhookgroup

While \txtbeforenotes is for typesetting text before notes, \bhookgroup{(s)}{(code)} and \bhookgroupX{(s)}{(code)} (for critical and familiar respectively) are for executing code before a group of notes, between the rules and the printing of the notes.
7.12 Options for block of notes

7.12.4 Spacing

\beforenotes You can change the vertical space before the rule of the critical notes with \beforenotes[\langle s\rangle\{\langle l\rangle\}]. The default value is 1.2em plus .6em minus .6em. Be careful, the standard \LaTeX \footnote rule used by \reledmac decreases by 3pt. This 3pt decrease is not changed by this command.

\beforenotesX You can change the vertical space printed before the rule of the familiar notes with \beforenotesX[\langle s\rangle\{\langle l\rangle\}]. The default value is 1.2em plus .6em minus .6em. Be careful, the standard \LaTeX \footnote rule, which is used by \reledmac, decreases 3pt. These 3pt are not changed by this command.

\prenotes You can set the space before the first series of critical notes printed on each page and set a different amount of space for each subsequent series on the page. You can do it with \prenotes[\langle l\rangle]. The default value is 0pt. You can disable this feature by setting the length to 0pt.

\prenotesX You can set the space before the first printed (in a page) series of familiar notes to be different from the space before other series. The default value is 0pt. You can do this with \prenotesX[\langle l\rangle]. You can disable this feature by setting the length to 0pt.

7.12.5 Rule

\afterrule You can change the vertical space printed after the rule of the critical notes with \afterrule[\langle s\rangle\{\langle l\rangle\}]. The default value is 0pt.

Be careful, the standard \LaTeX \footnote rule, which is used by \reledmac, adds 2.6pt. These 2.6pt are not changed by this command.

\afterruleX You can change the vertical space printed after the rule of the familiar notes with \afterruleX[\langle s\rangle\{\langle l\rangle\}]. The default value is 0pt.

Be careful, the standard \LaTeX \footnote rule, which is used by \reledmac, adds 2.6pt. These 2.6pt are not changed by this command.

7.12.6 Maximum height

\maxhnotes By default, one series of critical notes can take up to 80% of \vsize, before being broken to the next page. If you want to change the size use \maxhnotes[\langle s\rangle\{\langle l\rangle\}]. Be careful: the length can’t be flexible, and is relative to the current font. For example, if you want the note to take, at most, 33% of the text height, do \maxhnotes{.33\textheight}.

\maxhnotesX \maxhnotesX[\langle s\rangle\{\langle l\rangle\}] is the same as previous, but for familiar footnotes.

Note that in many cases, you should call these commands in the begin of the document, because the \vsize in the preamble is not the same as \vsize after the preamble. That why we recommend to you to add in your preamble

\AtBeginDocument{
    \maxhnotesX{0.8\textheight}
    \maxhnotes{0.8\textheight}
}
Be careful with the two previous commands. Actually, for technical purposes, one paragraphed note is considered as one block. Consequently, it cannot be broken between two pages, even if you used these commands. The debug is in the todolist.

7.12.7 Width
\texttt{\textbackslash width}\langle l\rangle\texttt{\textbackslash widthX}\langle l\rangle sets the total width of critical footnotes. \texttt{\textbackslash widthX}\langle l\rangle does the same for familiar footnotes.

\langle l\rangle can be a length expression, parsable with \texttt{\textbackslash dimexpr}. For example:

\texttt{\textbackslash width\{columnwidth+\marginparsep+\ledrsnotewidth\}}
\texttt{\textbackslash widthX\{columnwidth+\marginparsep+\ledrsnotewidth\}}

Note that changes the width of the block of notes. If you want to change the width of each column when typesetting notes in columns, use \texttt{\textbackslash Xsizetwocol}, \texttt{\textbackslash Xsizethreecol}, \texttt{\hsizetwocol}, \texttt{\hsizethreecol}, see 7.10.2 p. 53.

7.13 Footnotes and the \texttt{reledpar} columns
\texttt{\textbackslash Xnoteswidthliketwocolumns}\langle s\rangle to create critical notes with a two-column size width.
\texttt{\textbackslash noteswidthliketwocolumnsX\langle s\rangle} to create familiar notes with a two-column size width.

7.14 Line number annotation
The way line number annotations are typeset can be changed using hooks as described in 5.5.2 p. 26 and 5.5.3 p. 27.

7.15 Endnotes in one paragraph
\texttt{\textbackslash Xendparagraph}\langle s\rangle to have all end notes of one given series set in one paragraph.
\texttt{\textbackslash Xendafternote}\langle s\rangle to add some space after a endnote series by using \texttt{\textbackslash Xendafternote\langle s\rangle\{\langle l\rangle\}}. The default value is 1em plus .4em minus .4em.
\texttt{\textbackslash Xendsep}\langle s\rangle\{\langle text\rangle\} to choose the separator between each note by \texttt{\textbackslash Xendsep\langle s\rangle\{\langle text\rangle\}}. A common separator is the double pipe (||), which you can set by using \texttt{\textbackslash Xendsep\{$\parallel$\}}.

8 Fonts
One of the most important features of the appearance of the notes, and indeed of your whole document, will be the fonts used. We will first describe the commands that give
you control over the use of fonts in the different structural elements of the document, especially within the notes, and then in subsequent sections specify how these commands are used.

\texttt{numlabfont}

Line numbers for the main text are usually printed in a smaller font in the margin. The \texttt{numlabfont} macro is provided as a standard name for that font: it is initially defined as

\texttt{newcommand{numlabfont}{\normalfont\scriptsize}}

You might wish to use a different font if, for example, you preferred to have these line numbers printed using old-style numerals.

\texttt{select@lemmafont}

We will briefly discuss \texttt{select@lemmafont} here because it is important to know about it now, although it is not one of the macros you would expect to change in the course of a simple job. Hence it is ‘protected’ by having the @-sign in its name.

When you use the \texttt{edtext} macro to mark a word in your text as a lemma, that word will normally be printed again in your apparatus. If the word in the text happens to be in a font such as italic or bold you would probably expect it to appear in the apparatus in the same font. This becomes an absolute necessity if the font is actually a different script, such as Arabic or Cyrillic. \texttt{select@lemmafont} does the work of decoding \texttt{reledmac}'s data about the fonts used to print the lemma in the main text and calling up those fonts for printing the lemma in the note.

\texttt{select@lemmafont} is a macro that takes one long argument—the cluster of line numbers passed to the note commands. This cluster ends with a code indicating what fonts were in use at the start of the lemma. \texttt{select@lemmafont} selects the appropriate font for the note using that font specifier.

\texttt{reledmac} uses \texttt{select@lemmafont} in a standard footnote format macro called \texttt{normalfootfmt}. The footnote formats for each of the layers A to E are \texttt{let} equal to \texttt{normalfootfmt}. So all the layers of the footnotes are formatted in the same way.

9 Verse

9.1 Basic

\texttt{stanza} at the start of a stanza. Each line in a stanza is ended by an ampersand (&), and the stanza itself is ended by putting \& at the end of the last line.

If you need to add brackets directly after \texttt{stanza}, & or \&, add \texttt{\norelax}. Otherwise, the brackets will be interpreted as delimitation of an optional argument (cf. 9.8 p. 60).

9.2 Define stanza indents

\texttt{stanzaindentbase} Lines within a stanza may be indented. The indents are integer multiples of the length \texttt{stanzaindentbase}, whose default value is 20pt.

\texttt{setstanzaindents} In order to use the stanza macros, one must set the indentation values. First the value of \texttt{stanzaindentbase} should be set, unless the default value 20pt is desired. Every stanza line indentation is a multiple of this.
To specify these multiples one invokes, for example
\texttt{\setstanzaindents{3,1,2,1,2}}.

The numerical entries must be whole numbers, 0 or greater, separated by commas without embedded spaces. The first entry gives the hanging indentation to be used if the stanza line requires more than one print line.

If it is known that each stanza line will fit in one print line, then this first entry should be 0; \TeX{} does less work in this case, but no harm ensues if the hanging indentation is not 0 but is never used.

If you want the hanging verse to be flush right, you can use \texttt{\sethanginsymbol}: see p.9.6 p.59.

Enumeration is by stanza lines, not by print lines. In the above example the lines are indented one unit, two units, one unit, two units, with 3 units of hanging indentation in case a stanza line is too long to fit on one print line.

\subsection*{9.3 Repeating stanza indents}

Since version 0.13, if the indentation is repeated every \textit{n} verses of the stanza, you can define only the \textit{n} first indentations, and indicate that they are repeated, defining the value of the \texttt{stanzaindentsrepetition} counter at \textit{n}. For example:

\texttt{\setstanzaindents{5,1,0}}
\texttt{\setcounter{stanzaindentsrepetition}{2}}

is like

\texttt{\setstanzaindents{5,1,0,1,0,1,0,1,0,1,0}}

Be careful: the feature is changed in eledmac 1.5.1. See A.3 p.395.

If you don't use the \texttt{stanzaindentsrepetition} counter, make sure you have at least one more numerical entry in \texttt{\setstanzavalues} than the number of lines in the stanza.

If you want to disable this feature again, just put the counter to 0:

\texttt{\setcounter{stanzaindentsrepetition}{0}}

The macros make no restriction on the number of lines in a stanza. Stanza indentation values (and penalty values) obey \TeX{}'s grouping conventions, so if one stanza among several has a different structure, its indentations (penalties) may be set within a group; the prior values will be restored when the group ends.

\subsection*{9.4 Manual stanza indent}

\texttt{\stanzaindent} \texttt{\stanzaindent*} You can set the indent of some specific verse by calling \texttt{\stanzaindent\{\texttt{value}\}} \texttt{at the beginning of the verse, before any other character. In this case, the indent defined by \texttt{\setstanzaindents} for this verse is skipped, and \texttt{\{\texttt{value}\}} is used instead.
If you use the mechanism of indent repetition, the next verse will be printed as it should be even if the current verse would have its normal indent value. In other words, using \stanzaindent in a verse does not shift the indent repetition.

However, if you want to shift the indent repetition, so the next verse has the indent normally used for the current verse, use \stanzaindent* instead of \stanzaindent.

9.5 Stanza breaking

When the stanzas run over several pages, it is often desirable that page breaks should arise between certain lines in the stanza, so a facility for including penalties after stanza lines is provided. If you are satisfied with the page breaks, you need not set the penalty values.

The command \setstanzapenalties{1,5000,10100,5000,0}
results in a penalty of 5000 being placed after the first and third lines of the stanza, and a penalty of \textasciitilde100 after the second.

The first entry “1” is a control value. If it is zero, then no penalties are passed on to \TeX, which is the default. Values between 0 and 10000 are penalty values; values between 10001 and 20000 have 10000 subtracted and the result is given as a negative penalty. The mechanism used for indentations and penalties requires unsigned values less than 32768. No penalty is placed after the last line, so the final 0 in the example above could be omitted. A penalty of 10000 will prevent a page break; such a penalty is included automatically where there is stanza hanging indentation. A penalty of \textasciitilde10000 (corresponding to the entry value 20000 in this context) forces a page break. Values in between act as suggestions as to the desirability of a page break at a given line. There is a subtle interaction between penalties and glue, so it may take some adjustment of skips and penalties to achieve the best results.

9.6 Hanging symbol

It is possible to insert a symbol in each line of hanging verse, as in French typography; for example, the opening bracket ‘[’. To insert it in \reledmac, use macro \sethangingsymbol{⟨h⟩} with this code. In the example of French typography, do

\sethangingsymbol{[\,}

You can also use it to force hanging verse to be flush right:

\sethangingsymbol{\protect\hfill}

9.7 Long verse and page break

If you want to prevent page breaks inside long verses, use the option nopbinverse when loading package, or use \lednopbinversetrue. Read \texttt{18.2 p. 77} for further details.
9.8 Content before/after verses

It is possible to add content, like a subtitle or a spacing, before or after verse:

- The \stanza command can take an optional argument (in brackets). Its content will be printed before the stanza. A \noindent is inserted before the content of first optional argument. If you don’t want this \noindent, you can use the second optional argument (also in brackets):

  \stanza[foo] \% noindent is inserted before foo.
  \stanza[](foo) \% There is no \noindent inserted before foo.

\AtEveryStanza • Use \AtEveryStanza\{\langle arg\rangle\} to automatically add content before stanzas (not in the same paragraph).

  Note that a \noindent will be inserted before the argument, and, consequently, a \parskip. You can use the starred version of \AtEveryStanza to avoid this \noindent.

\AtStartEveryStanza • Use \AtStartEveryStanza to automatically add content at the beginning of stanzas.

  & can be replaced by \newverse with two optional arguments (in brackets). The first will be printed after the current verse, the second before the next verse.

  A \noindent is automatically inserted before the contents of these optional arguments.

  Use a third and fourth optional argument to not add these \noindents (to add content respectively after the current verse / before the next verse).

\AtEveryPend • Use \AtEveryPend\{\langle arg\rangle\} to automatically add content after verses (including the final one) and \AtEveryPstart\{\langle arg\rangle\} to automatically add content before verses (including the first one).

\AtEveryStopStanza • \& can take an optional argument (in brackets). Its content will be printed after the stanza.

\BeforeEveryStopStanza • Use \BeforeEveryStopStanza to automatically add content at the end of stanzas (in the same paragraph).
9.9 Numbering stanza

\numberstanzatrue
\numberstanzafalse

If you want to automatically number stanzas, use \numberstanzatrue. In this case, the line number will restart at each \stanza.

If you want to disable this feature again, use \numberstanzafalse.

You can use this feature in combination with \Xstanza (7.2.9 p. 47).

You can redefine \thestanza to change the aspect of stanza number. Default value is:

\renewcommand{\thestanza}{\textbf{\arabic{stanza}}}

You can change the value of the stanza counter with the usual commands of \LaTeX.

You can redefine \stanzanumwrapper in order to modify the way the stanza number is inserted in the flow of text. Default value is:

\newcommand{\stanzanumwrapper}[1]{\flagstanza{#1}}

9.10 Various tools

\ampersand
\flagstanza

If you need to print an & symbol in a stanza, use the \ampersand macro, not \& as this will end the stanza.

Putting \flagstanza[⟨len⟩]{⟨text⟩} at the start of a line in a stanza (or elsewhere) will typeset ⟨text⟩ at a distance ⟨len⟩ before the line. The default ⟨len⟩ is \stanzaindentbase.

9.11 Notes on empty lines

Since v2.3.0 of \reledmac, empty lines when typesetting verses no longer produce new paragraphs, and consequently, do not insert vertical spaces. Use optional argument of \stanza or \newverse to insert vertical space (9.8 p. 60).

10 Grouping

In a minipage environment \LaTeX changes \footnote numbering from arabic to alphabetical and puts the footnotes at the end of the minipage.

You can put numbered text with critical footnotes in a minipage and the footnotes are set at the end of the minipage.

You can also put familiar footnotes (see section 6.5) in a minipage but unlike with \footnote the numbering scheme is unaltered.

Minipages, of course, are not broken across pages. Footnotes in a ledgroup environment are typeset at the end of the environment, as with minipages, but the environment
includes normal page breaks. The environment makes no change to the textwidth so it appears as normal text; it just might be that footnotes appear in the middle of a page, with text above and below.

The \texttt{ledgroupsized} environment is similar to \texttt{ledgroup} except that you must specify a width for the environment, as with a minipage.

\begin{ledgroupsized}\langle\textwidth\rangle \{\langle\textwidth\rangle\}

The required \texttt{(width)} argument is the text width for the environment. The optional \texttt{(pos)} argument is for positioning numbered text within the normal textwidth. It may be one of the characters:

\begin{itemize}
\item \texttt{l} (left) numbered text is flush left with respect to the normal textwidth. This is the default.
\item \texttt{c} (center) numbered text is in the center of the textwidth.
\item \texttt{r} (right) numbered text is flush right with respect to the normal textwidth.
\end{itemize}

Note that normal text, footnotes, and so forth are all flush left.

\begin{ledgroupsized}{\textwidth}\end{ledgroupsized} is effectively the same as \begin{ledgroup}\end{ledgroup}

11 Cross referencing

The package provides a simple cross-referencing facility that allows you to mark places in the text with labels, and generate page and line number references to those places elsewhere using those labels.

11.1 Basic use

First you place a label in the text using the command \texttt{\ledlabel{\langle lab\rangle}}. \langle lab\rangle can be almost anything you like, including letters, numbers, punctuation, or a combination—anything but spaces; you might type \texttt{\ledlabel{toves-3}}, for example.\footnote{More precisely, you should stick to characters in the \LaTeX{} categories of “letter” and “other.”}

Elsewhere in the text, either before or after the \texttt{\ledlabel}, you can refer to its location with \texttt{\ledpageref{\langle lab\rangle}}, \texttt{\ledlineref{\langle lab\rangle}}, \texttt{\ledsublineref{\langle lab\rangle}}, \texttt{\pstartref{\langle lab\rangle}} or \texttt{\annotationref{\langle lab\rangle}}, that will produce, respectively, the page, line, sub-line, pstart, the annotation, on which the \texttt{\ledlabel{\langle lab\rangle}} command occurred.

Note that the \texttt{\ledlineref} command insert the side flag after the line number.

An \texttt{\ledlabel} command may appear in the main text, or in the first argument of \texttt{\ledtext}, but not in the apparatus itself. But \texttt{\ledpageref}, \texttt{\ledlineref}, \texttt{\ledsublineref}, \texttt{\pstartref} commands can also be used in the apparatus to refer to \texttt{\ledlabels} in the text.

The \texttt{\ledlabel} command works by writing macros to \LaTeX{}.aux file. You will need to process your document through \LaTeX{} twice in order for the references to be resolved.

You will be warned if you use \texttt{\ledlabel{foo}} and \texttt{foo} has been used as a label before. The \texttt{\ref} commands will return references to the last place in the file marked
11.2 Cross-referencing to a critical note

If you want to refer to a word which is a lemma word, the \edlabel command should be in the first argument of \edtext command.

If you want to refer to the content of a \Xfootnote, the line and subline number printed will be the start line.

If you want to refer to starting and ending lines, you should use \appref and related tools (11.6.2 p. 65).

However, there are situations in which you will want reledmac to return a number without displaying any warning messages about undefined labels or the like: if you want to use the reference in a context where \LaTeX is looking for a number, such a warning will lead to a complaint that the number is missing. This is the case for references used within the argument to \linenum, for example (see 6.2.5 p. 32).

For this situation, reledmac supplies variants of the reference commands, with the \prefix: \xpageref, \xlineref, \xsublineref, \xpstartref and \xannotationref. They have the following limitations:

- They will not tell you if the label is undefined.
- They must be preceded in the file by at least one of the four other cross-reference commands—e.g., a \edlabel{foo} command, even if you never refer to that label—since those commands can all do the necessary processing of the .aux file, and the \x... ones cannot.
- When hyperref is loaded, the hyperref link will not be added. (Indeed, it is not a limitation, but a feature.)
- With reledpar, the \xlineref does not insert the right side flag, in order to obtain a line number. Use \xflagref to obtain the side flag, depending of your flag.

11.3 Cross-referencing which return a number in any case

The \xxref{⟨lab1⟩}{⟨lab2⟩} command generates a reference to a sequence of lines, for use in the second argument of \edtext. It takes two arguments, both of which are labels: e.g., \xxref{mouse}{elephant}.

It automatically calls \linenum (6.2.5 p. 32) and \lineannot (5.5.1 p. 26) and sets the beginning page, line, subline numbers and line annotations to those of the
place where \label{mouse} was placed, and the ending ones to those where \label{elephant} occurs.

For example, one might use the following:

\beginnumbering
\pstart
\label{Queritur}Queritur utrum metaphysica sit scientia una.
\pend
\pstart
\text{Et videtur quod non}\label{non}.\xxref{Queritur}{non}\lemma{queritur \dots{} non}\Afootnote{om. \emph{A}}
\pend
\endnumbering

11.4 Not automatic cross-referencing

\edmakelabel Sometimes the \label command cannot be used to specify exactly the page and line desired—for example, if you want to refer to a page and line number in another volume of your edition. In such cases, you can use the \edmakelabel{⟨lab⟩}{⟨numbers⟩} macro so that you can ‘roll your own’ label.

For example, if you type ‘\edmakelabel{elephant}{10|25|0}’ you will create a new label, and a later call to \edpageref{elephant} would print ‘10’ and \lineref{elephant} would print ‘25’. The sub-line number here is zero. It is usually best to collect your \edmakelabel statements near the top of your document, so that you can see them at a glance.

11.5 Normal \LaTeX cross-referencing

\label, \ref and \pageref macros may be used within numbered text, and operate in the familiar fashion.

11.6 References to start and end lines

11.6.1 Reference to main text lines

Many times, you may want to make a cross-reference to a passage that is defined by a start line and an end line. reledmac provides specific tools for this scenario.

\edlabelS Use \edlabelS{⟨label⟩} to mark the start line of the passage.
\edlabelE Use \edlabelE{⟨label⟩} to mark the end line of the passage. These two commands just create two labels which are named ⟨label⟩:start and ⟨label⟩:end.
\edlabelSE Use \edlabelSE{⟨label⟩} to mark just one location in the text. Contrary to a classical \label, the ⟨label⟩ could be used with \SEref and \SErefwithpage.
\SEref The main utility is to use them with three other commands. \SEref{⟨label⟩} will make a cross-reference printed as a reference in critical footnotes.
\SErefwithpage \SErefwithpage will make a cross-reference printed as a reference in critical end-
11.6 References to start and end lines

\SErefonlypage \SErefonlypage will make a cross-reference printed only with page number.

11.6.2 References to lines that are commented on in the apparatus

You may want to make a cross-reference to a passage that is referred to by \edtext. reledmac provides specific tools for this scenario.

If you use \applabel{⟨label⟩} inside the second argument of a \edtext, reledmac will add a \edlabel at the beginning and end of the marked passage. The label at the beginning of the passage will have the title ⟨label⟩:start, while the label at the end will have the title ⟨label⟩:end.

If you use \linenum{6.2.5 p.32} to refer to these labels, reledmac will use your line settings to refer to the passage.

You can also use \appref{⟨label⟩} and \apprefwithpage{⟨label⟩} to refer to these lines. The first one will print the lines as they are printed in the critical footnotes, while the second will print the lines as they are printed in endnotes.

11.6.3 Settings

Specific to these tools  If you use \apprefprefixsingle{⟨prefix⟩}, ⟨prefix⟩ will be printed before the line numbers of a \appref-reference. If you use \apprefprefixmore{⟨prefix⟩}, ⟨prefix⟩ will be printed before the line numbers, if you refer to more than one line.

For example, you may use:

\apprefprefixsingle{line~}
\apprefprefixmore{lines~}

Note that if you do not use \apprefprefixmore, the argument of \apprefprefixsingle will be used in any case.

\setapprefprefixsingle \setapprefprefixmore are similar for \SEref command.

Use \setSErefonlypageprefixsingle{⟨prefix⟩} to set the page prefix for \SErefonlypage when there is only one page. Use \setSErefonlypageprefixmore{⟨prefix⟩} to set it when there is more than one page. For example:

\setSErefonlypageprefixsingle{p.~}
\setSErefonlypageprefixmore{pp.~}

Note that if you do not use \setSErefonlypageprefixmore, the value of \setSErefonlypageprefixsingle is used instead.

Also note that \setSErefonlypageprefixsingle is only a shortcut for \XendbeforepagenumberSErefonlypage (see 11.6.3 p.66). So if you use \Xendbeforepagenumber without any optional argument, it will override this setting.
Linked to setting of critical footnotes and endnotes Some commands which set the appearance of line numbers in critical footnotes also set the appearance of line numbers in \appref and \SEref if called without the optional series argument. These commands are the following:

- \Xlineflag (for reledpar), enabled by default.
- \Xlinerangeseparator
- \Xmorethantwolines
- \Xsublinesep
- \Xtwolines
- \Xtwolinesbutnotmore
- \Xtwolinesonlyinsamepage
- \Xlinenumannotationposition
- \Xwraplinenumannotation
- \Xnoidenticallinenumannotation

If you want to make settings specific to \appref or \SEref, just call them with an optional argument containing a comma-separated list of command names (for example appref,SEref) or with a suffix equal to the command name (for example appref).

The same principle is available for \apprefwithpage, \SErefwithpage and \SErefonlypage with the following commands:

- \Xendafterpagenumber (not for \SErefonlypage)
- \Xendbeforepagenumber
- \Xendlineflag (for reledpar), enabled by default.
- \Xendlineprefixmore
- \Xendlineprefixsingle
- \Xendlinerangeseparator
- \Xendmorethantwolines
- \Xendsublinesep
- \Xendtwolines
- \Xendtwolinesbutnotmore
- \Xendtwolinesonlyinsamepage
- \Xendlinenumannotationposition
- \Xendwraplinenumannotation
- \Xemdoidenticallinenumannotation
For one specific command When calling `\appref` and `\SEref`, you can use as a first optional argument, in brackets ([]), any optional argument which can be used for critical footnotes [6.2.2 p. 30].

When calling `\apprefwithpage`, `\SErefwithpage` or `\SErefonlypage` you can use as a first optional argument, in brackets ([]), any optional argument which can be used for critical endnotes [6.2.3 p. 30].

11.6.4 Combining multiple references

When combining multiple cross references into a list, it is possible to prevent prefixes reappearing by adding an optional argument to `\appref` and `\SEref`. The available options are:

- `noprefix` to remove any prefix set by `\setappreffixsingle` or the equivalent for a single reference;
- `prefixmore` to force the plural version of a prefix.

For example, a reference to 'lines 65–66, 72, and 75' might use `\SEref[prefixmore]{ref1}`, `\SEref[noprefix]{ref2}`, and `\SEref[noprefix]{ref3}` to achieve this result.

11.7 Compatibility with xr package

The `\externaldocument` command of the `xr` package allows making cross-references from an external document, with the standard \LaTeX\ commands `\label` and `\ref` (and related).

To use it with the `reledmac` cross-reference commands (i.e. `\edlabel` and related), you must do the following:

1. Load the `xr` package.
2. Load the `reledmac` package.
3. Use the `\externaldocument` document command.

12 Sidenotes

12.1 Basics

The `\marginpar` command does not work in numbered text. Instead, the package provides for non-floating sidenotes in either margin.

- `\ledinnernote` put ⟨text⟩ into the inner margin level with where the command was issued. Similarly, `\ledouternote` puts ⟨text⟩ in the outer margin.
- `\ledleftnote` put ⟨text⟩ into the margin specified by the current setting of `\sidenotemargin{location}`. The permissible value for ⟨location⟩ is one out of the list left, right, inner, or outer; for example `\sidenotemargin{outer}`.
- `\ledrightnote`
- `\ledsidenote`
- `\sidenotemargin` The package’s default setting is
12.2 Setting

12.2.1 Width

\ledlnotewidth \ledrnotewidth The left sidenote text is put into a box of width \ledlnotewidth and the right text into a box of width \ledrnotewidth. These are initially set to the value of \marginparwidth.

12.2.2 Vertical position

\rightnotupfalse \leftnotupfalse By default, sidenotes are placed to align with the last line of the note to which it refers. If you want them to be placed to align with the first line of the note to which it refers, use \leftnotupfalse (for left note) and/or \rightnotupfalse (for right note).

12.2.3 Distance to the main text

\ledlnotesep \ledrnotesep The texts are put a distance \ledlnotesep (or \ledrnotesep) into the left (or right) margin. These lengths are initially set to the value of \linenumsep.

12.2.4 Font

\ledlnotefontsetup \ledrnotefontsetup These macros specify how the sidenote texts are to be typeset. The initial definitions are:

\newcommand*{\ledlnotefontsetup}{\raggedleft\footnotesize}% left
\newcommand*{\ledrnotefontsetup}{\raggedright\footnotesize}% right

These can of course be changed to suit.

12.2.5 Separator between notes

\setsidenotesep If you have two or more sidenotes for the same line, they are separated by a comma. But if you want to change this separator, you can use \setsidenotesep{(sep)}.
13 Indexing

13.1 Basics

\index{item} provides the \index{item} command for specifying that \textit{item} and the current page number should be added to the raw index (idx) file. The \index{item} macro can be used in numbered text to specify that \textit{item} and the current page & linenumber should be added to the raw index file.

Note that the file .idx will contain the right reference only after the third run, because of the internal indexing mechanism of reledmac. That means you must first run (Xe/Lua)L\TeX{} three times, then run \texttt{makeindex}, and then finally run (Xe/Lua)L\TeX{} again, in order to get an index with the right page numbers.

Also note that using \edtext{} in familiar footnotes refers to the line where the footnotes are called.

13.2 Use with \texttt{imakeidx} or \texttt{indextools}

If the \texttt{imakeidx} or \texttt{indextools} package is used then the macro takes an optional argument, which is the name of a raw index file. For example \edindex[line]{item} will use line.idx as the raw file instead of jobname.idx.

The minimal version of \texttt{imakeidx} package to be used is the version 1.3a uploaded on CTAN on 2013/07/11.

Be careful with the order of package loading and index declaration. You must use this order:

1. Load \texttt{imakeidx} or \texttt{indextools}.
2. Load reledmac.
3. Declare the index with the macro \texttt{makeindex} of \texttt{imakeidx} and \texttt{indextools}.

13.3 Referring to critical notes

If you want to refer to a word inside an \edtext{lemma}{app} command, \index{} should be defined inside the first argument, e.g.,

\texttt{The \edtext{creature}{\index{elephant}} was quite unafraid}{\texttt{\footnote{Of the mouse, that is.}}}

If you add \index{} inside some \texttt{Xfootnote} command, it will refer to that note, and a suffix \texttt{n} will be appended to the reference. You can redefine this suffix by redefining the command \texttt{\ledinnotemark}. Its actual definition is:

\newcommand{\ledinnotemark}[1]{\#1\texttt{\emph{n}}}

Where \#1 stands for the reference.
13.4 Separator between page and line numbers

The page & linenumber combination is written as \texttt{page\pagelinesep line}, where
the default definition is \texttt{\newcommand\{\pagelinesep\}{-}} so that an item on page 3,
line 5 will be noted as being at 3-5. You can renew \texttt{\pagelinesep} to get a different
separator.

- is the default separator used by the \texttt{MAKEINDEX} program.

You can reconfigure it, this example defines a colon as separator:

\renewcommand{\pagelinesep}{::}

However, you also have to configure your .\texttt{ist} index style file. For example, if you
use : as separator\footnote{For further detail, you can read \url{http://tex.stackexchange.com/a/32783/7712}}

\texttt{page_compositor ":"}

Read the \texttt{MAKEINDEX} program’s handbook about the .\texttt{ist} file.

13.5 Using \texttt{xindy}

Should you decide to use \texttt{xindy} instead of \texttt{makeindex} to transform your .\texttt{idx} files
into .\texttt{ind} files, you must use some specific configuration file (.\texttt{xdy}) so that \texttt{xindy} can
understand \texttt{reledmac} reference syntax of which the scheme is:

\texttt{pagenumber-linenumber}

An example of such a file is provided in the \texttt{examples} folder. Read the \texttt{xindy} hand-
book to learn how to use it\footnote{Or, for people who read French, read \url{http://geekographie.maieul.net/174}}.

This file also provides, with an explanation, the settings that are needed to put
\texttt{reledmac} lines numbers in parenthesis, in order to make a better distinction between
line numbers and page ranges.

In any case, you must load \texttt{reledmac} with the \texttt{xindy} option, in order to generate a
\texttt{.xdy} file which is specific to your document. This file is needed by the \texttt{.xdy} example file
which is in the \texttt{examples} folder. Its default name is \texttt{reledmac-markup-attr.xdy}, but
you can change it by using your own as an argument of the \texttt{xindy+hyperref} option.

If you choose to use both \texttt{xindy} and the \texttt{hyperref} package, you must do three more
things:

1. Use \texttt{xindy+hyperref} option when loading the \texttt{reledmac} package. When you
   run \texttt{(Xe/Lua)\LaTeX} with this option, a .\texttt{xdy} configuration file will be generated with
   all the settings needed to allow internal hyperlinking in each index entry which
   is created by \texttt{\edindex}.

2. Use \texttt{hyperindex=false} option when loading \texttt{hyperref}.

\footnote{Or, for people who read French, read \url{http://geekographie.maieul.net/174}}
3. Uncomment — by removing the semicolons at the beginning of the relevant lines — some lines in the `<code>.xdy</code>` file provided in the "examples" folder in order to restore internal links in the index to be used by the standard index command.\footnote{These are the recommended lines to provide the best possible compatibility between hyperref and xindy, even without using reledmac.}

### 13.6 Advanced setting

The \texttt{\textbackslash edindex} process uses a \texttt{\textbackslash label} and \texttt{\textbackslash ref} mechanism to get the correct line number. It automatically generates labels of the form \texttt{\textbackslash label\{\texttt{\textbackslash edindexlab N}\}}, where \texttt{N} is a number, and the default definition of \texttt{\textbackslash edindexlab} is:

\begin{verbatim}
\newcommand*{\edindexlab}{\$&}
\end{verbatim}

in the hopes that this will not be used by any other labels (\texttt{\textbackslash edindex}'s labels are like \texttt{\textbackslash label\{$&27$\}}). You can change \texttt{\textbackslash edindexlab} to something else if you need to.

### 14 Glossary

\texttt{reledmac} provides mechanism to make glossaries with the \texttt{glossaries} package, referring not to the page, but to the page and line.

#### 14.1 Preamble setting

The standard compositor between page and line number in \texttt{reledmac} is a dash, while \texttt{glossaries} uses, by default, a dot. Consequently, you must:

- Or set \texttt{\textbackslash glossaries}:
  \begin{verbatim}
  \glsSetCompositor{-}
  \end{verbatim}

- Or set \texttt{\textbackslash reledmac}:
  \begin{verbatim}
  \renewcommand{\pagelinesep}{.}
  \end{verbatim}

In this case, the above will have consequences for your use of \texttt{\textbackslash edindex} and you should set your .\texttt{ist} file [13.4 p. 70].

#### 14.2 Commands

The \texttt{\textbackslash gls}, \texttt{\textbackslash Gls}, and related commands of \texttt{glossaries} packages have a prefixed version with \texttt{ed}, which refers to the page line. The argument are the same as for the standard commands. So for example:

\begin{verbatim}
\texttt{\textbackslash edgls[\{options\}]{\{label\}}[\{insert\}]}
\end{verbatim}

### 15 Tabular material

\LaTeX{}'s normal \texttt{tabular} and \texttt{array} environments cannot be used where line numbering is being done; more precisely, they can be used but with odd results, so don’t use
them. However, \relmac provides some simple tabulation environments that can be
line numbered. The environments can also be used in normal unnumbered text.

There are six environments; the \edarray environments are for math and \edtabular for
text entries. The final l, c, or r in the environment names indicate that the entries
will be flushleft (l), centered (c) or flushright (r). There is no means of specifying dif-
ferent formats for each column, nor for specifying a fixed width for a column. The
environments are centered with respect to the surrounding text.

\begin{edtabularc}
  1 & 2 & 3 \\
  a & bb & ccc \\
  AAA & BB & C
\end{edtabularc}

Entries in the environments are the same as for the normal \array and \tabular
environments but there must be no ending \\ at the end of the last row. *There must be
the same number of column designators (the &) in each row.* There is no equivalent to any
line drawing commands (such as \hline). However, unlike the normal environments,
the ed... environments can cross page breaks.

Macros like \edtext can be used as part of an entry.

For example:

\begin{verbatim}
\begin{edtabularl}
  \textbf{\Large I} & wish I was a little bug & \edindex{bug} &
  \textbf{\Large I} & eat my peas with honey & \edindex{honey} &
  & With whiskers & \edtext{round}{\Afootnote{around}} my tummy &
  & I’ve done it all my life. &
  & I’d climb into a honey & \edindex{honey} & pot &
  & It makes the peas taste funny &
  & And get my tummy gummy. & \edindex{gummy} &
  & But it keeps them on the knife.
\end{edtabular}
\end{verbatim}

produces the following parallel pair of verses.

1. I wish I was a little bug I eat my peas with honey
2. With whiskers round my tummy I’ve done it all my life.
3. I’d climb into a honey pot It makes the peas taste funny
4. And get my tummy gummy. But it keeps them on the knife.

The distance between the columns is controlled by the length \edtabcolsep.

\spmath{⟨math⟩} typesets ⟨math⟩ but the {⟨math⟩} has no effect on the
calculation of column widths. \spreadtext{⟨text⟩} is the analagous command for use
in \edtabular environments.
The macro \edrowfill{\langle start\rangle}{\langle end\rangle}{\langle fill\rangle} fills columns number \langle start\rangle to \langle end\rangle inclusive with \langle fill\rangle. The \langle fill\rangle argument can be any horizontal ‘fill’. For example, \hrulefill or \upbracefill.

Note that every row must have the same number of columns, even if some would not appear to be necessary.

The \edrowfill macro can be used in both tabular and array environments. The typeset appearance of the following code is shown below.

\begin{edtabularr}
1 & 2 & 3 & 4 & 5 \\
Q & & & fd & h & qwertziohg \\
v & wptz & x & y & & vb \\
g & nnn & \edrowfill{3}{5}{\upbracefill} & & & \\
\edrowfill{1}{3}{\downbracefill} & & & pq & dgh \\
k & & & 1 & co & ghweropjklmnbvcxys \\
1 & 2 & 3 & \edrowfill{4}{5}{\hrulefill} & & \\
\end{tabularr}

You can also define your own ‘fill’. For example:

\newcommand*{\upbracketfill}{\%\vrule height 4pt depth 0pt\hrulefill\vrule height 4pt depth 0pt}

is a fill like \upbracefill except it has the appearance of a (horizontal) bracket instead of a brace. It can be used like this:

\begin{edarrayc}
1 & 2 & 3 & 4 \\
a & \edrowfill{2}{3}{\upbracketfill} & & d \\
A & B & & C & D \\
\end{edarrayc}
\texttt{\textbackslash datleft} \{ \texttt{\textbackslash symbol} \} \{ \texttt{\textbackslash halfheight} \} typesets the math \{ \texttt{\textbackslash symbol} \} as \texttt{\textbackslash left} \{ \texttt{\textbackslash symbol} \} with the optional \{ \texttt{\textbackslash math} \} centered before it. The \{ \texttt{\textbackslash symbol} \} is twice \{ \texttt{\textbackslash halfheight} \} tall. The \texttt{\textbackslash datright} macro is similar and it typesets \texttt{\right} \{ \texttt{\textbackslash symbol} \} with \{ \texttt{\textbackslash math} \} centered after it.

\begin{verbatim}
\begin{verbatim}
\texttt{\begin{edarrayc}
  & 1 & 2 & 3 & \\
  & 4 & 5 & 6 & \\
\texttt{\textbackslash datleft[= left\}]}\{}\{1.5\baselineskip\
  & 7 & 8 & 9 & \\
\texttt{\textbackslash datright[= right\}]}\{}\{1.5\baselineskip\
\end{edarrayc}

\texttt{left} = \begin{pmatrix}
  1 & 2 & 3 \\
  4 & 5 & 6 \\
  7 & 8 & 9
\end{pmatrix} = \texttt{right}
\end{verbatim}
\end{verbatim}

\texttt{\edibeforetab} \{ \texttt{\textbackslash text} \} \{ \texttt{\entry} \}, where \{ \texttt{\entry} \} is an entry in the leftmost column, typesets \{ \texttt{\textbackslash text} \} left justified before the \{ \texttt{\entry} \}. Similarly \ediaftertab \{ \texttt{\entry} \} \{ \texttt{\textbackslash text} \}, where \{ \texttt{\entry} \} is an entry in the rightmost column, typesets \{ \texttt{\textbackslash text} \} right justified after the \{ \texttt{\entry} \}.

For example:

\begin{verbatim}
\begin{verbatim}
\texttt{\begin{edarrayl}
  A & 1 & 2 & 3 \\
  B & 1 & 3 & 6 \\
\texttt{\edibeforetab\{Before\}} & 1 & 3 & 6 \\
  C & 1 & 4 & \ediaftertab\{\texttt{After}\} & \\
  D & 1 & 5 & 0
\end{edarrayl}

\texttt{Before}
A \hspace{1em} B \hspace{1em} C \hspace{1em} D \hspace{1em} E
\texttt{After}
C \hspace{1em} D \hspace{1em} E
\end{verbatim}
\end{verbatim}

\begin{verbatim}
\texttt{\ediuline} \{ \texttt{\textbackslash height} \} \{ \texttt{\textbackslash text} \} draws a vertical \{ \texttt{\textbackslash height} \} high (contrast this with \texttt{\textbackslash datright} where the size argument is half the desired height).

\begin{verbatim}
\texttt{\begin{edarrayr}
  a & b & C & d & e \\
  m & n & o & p & q
\texttt{\ediuline}\{4pc\}
\end{edarrayr}}
\end{verbatim}
\end{verbatim}
The \edvertdots macro is similar to \edvertline except that it produces a vertical dotted instead of a solid line.

16 Sectioning commands

16.1 Sectioning commands without line numbers or critical notes

The standard sectioning commands (\chapter, \section etc.) can be used inside numbered text. In this case, you must call them as an optional argument of \pstart (5.2.3 p. 19):

\pstart[\section{section}]
Pstart content.
\pend

The line which contains them will not be numbered, and you cannot add critical notes inside.

16.2 Sectioning commands with line numbering and critical notes

You have to use the following commands:

• \eledchapter[\langle\text\rangle]{\langle\text{critical text}\rangle},
• \eledchapter*,
• \eledsection[\langle\text\rangle]{\langle\text{critical text}\rangle},
• \eledsection*,
• \eledsubsection[\langle\text\rangle]{\langle\text{critical text}\rangle},
• \eledsubsection*,
• \eledsubsubsection[\langle\text\rangle]{\langle\text{critical text}\rangle},
• \eledsubsubsection*.

These are equivalent to the \TeX commands. Each individual command must be called alone in a \pstart... \pend:

\pstart
\eledsection*{xxxx\ledsidenote{section}}
After the first run, you will see only the text. This is normal. After the second run, you will see the formatting. Finally, with the third run, you will see the table of contents.

For technical reasons, the page break before `\elechapter` cannot be added automatically. You have to insert it manually via `\beforeelechapter`, which must be called outside of a numbered section.

16.3 Optimization

If you are not going to have any `\eledxxx` commands, then load `reledmac` with `noeledsec` option. That will suppress the generation of unneeded `.eledsec` files, save memory, and make `reledmac` run faster.

17 Quotation environments

The quotation and quote environments can be used so that the same definition/note appears both inside and outside a numbered section. The typographical consequences will resemble the outside numbered sections, based on the styles of the `book` class. However, if you use a package that redefines these environments, these redefinitions won’t be available inside the numbered section. You must open any quotation environments inside a `\pstart`...`\pend` block, not outside. A quotation environment MUST NOT be opened immediately after a `\pstart` and MUST NOT be closed immediately before a `\pend`.

In some cases, you do not want these environments to be redefined in numbered sections. You can load the package with the option `noquotation` to prevent this redefinition.

18 Page breaks

18.1 Control page breaking

`reledmac` and `reledpar` break pages automatically. However, you may sometimes want to either force page breaks, or prevent them. The packages provide two macros:

- `\eledpb` adds a page break.
- `\elednopb` prevents a page break, by adding one line to the current page if needed.
18.2 Prevent page break in a long verses

These commands have effect only at the second run.

These two commands take effect at the beginning of line in which they are called. For example, if you call `\ledpb` at l. 444, then l. 443 will be at p. \textit{n}, and l. 444 at p. \textit{n} + 1. However, you can change the behavior and decide they will have effect after the end of the line, adding `\ledpsetting{after}` at the beginning of your file (better: in your preamble). With the previous example, l. 444 will be on p. \textit{n} and l. 445 will be on p. \textit{n} + 1.

If you are using `reledpar` to typeset parallel pages, you must use `\lednopb` on both sides in the two corresponding lines. This is especially important when you are using stanzas; otherwise, the pages will be out of sync.

18.2 Prevent page break in a long verses

You can also decide to prevent page breaks between two lines of a long verse. To do this, use `nopbinverse` when loading package, or add `\lednopbinversetrue` in the beginning of your file (better: in your preamble).

This feature works only with verse of 2 lines and no more. It works on the third run, or on the fourth run if using `reledpar`. By default, when a long verse runs between two pages, a page break will be placed at the beginning of the verse. However, if you have added `\ledpsetting{after}`, the page break will be placed at the end of the long verse and the page containing the long verse will have one extra line.

19 Miscellaneous

When the package assembles the name of the auxiliary file for a section, it prefixes `\extensionchars` to the section number. This is initially defined to be empty, but you can add some characters to help distinguish these files if you like; what you use is likely to be system-dependent. If, for example, you said `\renewcommand{\extensionchars}{!}`, then you would get temporary files called `jobname.!1`, `jobname.!2`, etc.

The package can take options. The option ‘final’, which is the default is for final typesetting; this sets `\ifledfinal` to TRUE. The other option, ‘draft’, may be useful during earlier stages and sets `\ifledfinal` to FALSE.

The lemma within the text is printed via `\showlemma{lemma}`. Normally, or with the ‘final’ option, the definition of `\showlemma` is:

```
\newcommand*{\showlemma}[1]{#1}
```

so it just produces its argument. With the ‘draft’ option it is defined as

```
\newcommand*{\showlemma}[1]{\textit{#1}}
```

so that its argument is typeset in an italic font, which may make it easier to check that all lemmas have been treated.

If you would prefer some other style, you could put something like this in the preamble:

```
\ifledfinal
  \renewcommand{\showlemma}[1]{\textbf{#1}}% or simply ...[1]{#1}
\else
  \renewcommand{\showlemma}[1]{\textbf{#1}}%
\fi
```
19.1 Known and suspected limitations

19.1.1 Non-standard geometry

If you use classes other than article or book, or if you use the geometry package, you should use maxhnotesX and/or \maxhnotes as explained in 7.12.6 p. 55 in order to prevent footnotes from overlapping the bottom margin.

19.1.2 floatrow package compatibility

The floatrow package must be loaded before the reledmac.

19.1.3 ‘No room for a new’

Sometimes, especially when using reledmac with other packages, you could obtain warning messages such ‘no room for a new count’ or ‘no room for a new write’.

In order to prevent such problems, the first thing is to use the options to optimize reledmac. For example, if you need only two series of notes, use the \texttt{series={A,B}} option. Read 16.3 p. 76 in order to know which are the available options.

However, if with these options you still have such messages, here are some tricks.

’no room for a new count’ is often caused by \texttt{biblatex} being used at the same time. Load reledmac (and reledpar) \texttt{before} biblatex.

’no room for a new write’ can be caused by multiple indexes. In this case, use \texttt{indextools} of \texttt{imakeidx} with the \texttt{splitindex} option, in order to obtain only one \texttt{.idx} file. If that does not solve your problem, you can use \texttt{morewrites} package. That should solve the problem, but \texttt{BibTeX} will be slower.

If after reading and applying these advices you have still problem, contact us with a minimal working example.

19.1.4 Marginal notes

In general, reledmac’s system for adding marginal line numbers breaks anything that makes direct use of the \texttt{BibTeX} insert system, which includes marginpars, footnotes and floats.

However, you can use both \texttt{\footnote} and the familiar footnote series notes in numbered text. A \texttt{\marginpar} in numbered text will throw away its contents and send a warning message to the terminal and log file, but will do no harm.

19.1.5 Paragraph shape

\texttt{\parshape} cannot be used within numbered text, except in a very restricted way.

\texttt{BibTeX} is a three-pass system, but even after a document has been processed three times, there are some tricky situations in which the page breaks decided by \texttt{T\LaTeX} never settle down. At each successive run, reledmac may oscillate between two different sets of page decisions. To stop this happening, should it arise, Wayne Sullivan suggested the inclusion of the quantity \texttt{\ballast}. The amount of \texttt{\ballast} will be subtracted from
19.1 Known and suspected limitations

the penalties which apply to the page breaks calculated on the previous run through \TeX{}, thus reinforcing these breaks. So if you find your page breaks oscillating, insert \setcounter{ballast}{100}
or some such figure, and with any luck the page breaks will settle down. Luckily, this problem does not crop up at all often.

19.1.6 Paragraphed footnotes

The restriction on explicit line-breaking in paragraphed footnotes, mentioned on 7.1 p. 43, and described in more detail on XIII.6.3 p. 195 really is a nuisance if that is something you need to do. There are some possible solutions, described by Michael Downes, but this area remains unsatisfactory.

If you use more than one series of paragraphed notes, it may happen, in some particular cases, that only the footnote rule, with no accompanying footnotes, be printed. In this case use \reledmac{} package option nopenalties which should solve the problem, but also may produce widow or orphan lines. For the time being, we have no solution of this problem.

For paragraphed footnotes \TeX{} has to estimate the amount of space required. If it underestimates this then the notes may get too long and run off the bottom of the text block. \footfudgefiddle{} can be increased from its default 64 (say, to 68) to increase the estimate. You have to use \renewcommand for this, like:
\renewcommand{\footfudgefiddle}{68}
Note that you must call it before \Xarrangement{} or \arrangementX{}.

Any settings to ‘geometry’ must be made before \Xarrangement{} / \arrangementX{}.

Finally, in many cases you should use \Xmaxhnotes{} and / or \maxhnotesX{} (7.12.6 p. 55), in order to define the maximum height relative to \textheight and not to \vsize, because the \vsize value is not the same inside and outside of the preamble.

19.1.7 Use with other packages

Because of \reledmac{}’s complexity, it may not play well with other packages. In particular \reledmac{} is sensitive to commands in the arguments to the \edtext{} and \*footnote macros (this is discussed in more detail in section \morenoexpands and in particular the discussion about \no@expands and \morenoexpands). You will have to see what works or doesn’t work in your particular case.

You can define the macro \morenoexpands{} to modify macros that you call within \edtext. Because of the way \reledmac{} numbers the lines the arguments to \edtext can be processed more than once and in some cases a macro should only be processed once. One example is the \colorbox macro from the color package, which you might use like this:
\edtext{\colorbox{mycolor}{lemma}}{\Afootnote{...\colorbox...}}

If you actually try this\footnote{Reported by Dirk-Jan Dekker in the CTT thread ’Incompatibility of “color” package’ on 2003/08/28.} you will find \TeX{} whinging ’Missing { inserted’, and then things start to fall apart. The trick in this case is to specify either:
\newcommand{\morenoexpands}{\let\colorbox=0}

or

\makeatletter
\newcommand{\morenoexpands}{\let\colorbox\@secondoftwo}
\makeatother

(\@secondoftwo is an internal \LaTeX macro that takes two arguments and throws away the first one.) The first incantation lets color show in both the main text and footnotes whereas the second one shows color in the main text but kills it in the lemma and footnotes. On the other hand if you use \textcolor instead, like

... \edtext{\textcolor{mycolor}{lemma}}{\Afootnote{...\textcolor{...}}}

there is no need to fiddle with \morenoexpands as the color will naturally be displayed in both the text and footnotes. To kill the color in the lemma and footnotes, though, you can do:

\makeatletter
\newcommand{\morenoexpands}{\let\textcolor\@secondoftwo}
\makeatother

It took Peter Wilson a little while to discover all this. If you run into this sort of problem you may have to spend some time experimenting before hitting on a solution.

If you want to use the option bottom of the footmisc package, you must load this package before the reledmac package.

19.2 Parallel typesetting

Peter Wilson has developed the ledpar package as an extension to ledmac specifically for parallel typesetting of critical texts. This also cooperates with the babel / polyglossia packages for typesetting in multiple languages. reledpar is the successor of the primitive ledpar package.

Peter Wilson also developed the ledarab package for handling parallel Arabic text in critical editions. However, this package is not maintained by Maieul Rouquette. You should use the capabilities of a modern TeX processor, like Xe(La)TeX
I Implementation overview

We present the reledmac code in roughly the order in which it is used during a run of \TeX. The order is exactly that in which it is read when you load the reledmac package, because the same file is used to generate this manual and to generate the \TeX package file.

Most of what follows consists of macro definitions, but there are some commands that are executed immediately—especially at the start of the code. The documentation generally describes the code from the point of view of what happens when the macros are executed, though. As each macro is introduced, its name is printed in the margin.

After package options, we begin with the commands you use to start and stop line numbering in a section of text (Section II). Next comes the machinery for writing and reading the auxiliary file for each section that helps us count lines, and for creating list macros encoding the information from that file (Section V); this auxiliary file will be read at the start of each section, to create those list macros, and a new version of the file will be started to collect information from the body of the section.

Next are commands for marking sections of the text for footnotes (Section VI), followed by the macros that take each paragraph apart, attach the line numbers and insertions, and send the result to the vertical list (Section VII). The footnote commands (Section XIII) and output routine (Section XXIII) finish the main part of the processing; cross-referencing (Section XXV) and endnotes (Section XX) complete the story.

In what follows, macros with an @ in their name are more internal to the workings of reledmac than those made up just of ordinary letters, just as in Plain \TeX (see The \TeXbook, p. 344). You are meant to be able to make free with ordinary macros, but the '@' ones should be treated with more respect, and changed only if you are pretty sure of what you are doing.

II Preliminaries

II.1 Links with original edmac

Generally, these are the modifications to the original edmac code:

- Replace as many \def’s by \newcommand’s as possible to avoid overwriting \TeX macros.
- Replace user-level \TeX counts by \LaTeX counters.
- Use the \LaTeX font handling mechanisms.
- Use \LaTeX messaging and file facilities.

II.2 Package declaration

Announce the name and version of the package, which is targeted for \LaTeX2e.
II Preliminaries

%<code>
\NeedsTeXFormat{LaTeX2e}
\ProvidesPackage{reledmac}[2020/04/19 v2.32.6 typesetting critical editions]
%

II.3 Package options

Use this to remember which option is used, set and execute the options with final as the default. We use \texttt{xkeyval} in order to manage options with argument.

\begin{verbatim}
\RequirePackage{xkeyval}
\end{verbatim}

II.3.1 Options of reledpar

Here, we define some booleans specific to \texttt{reledpar} options, but which have consequences on \texttt{reledmac} internal commands.

\begin{verbatim}
\newif\ifparledgroup
\ifsameparallelpagenumber
\ifprevpgnotnumbered
\ifledfinal
\ifnocritical@
\if@noeled@sec
\ifnoend@
\ifnofamiliar@
\ifnoledgroup@
\ifparapparatus@
\iflednopbinverse
\ifwidthliketwocolumns
\ifxindy@
\ifxindyhyperref@
\ifeledmaccompat@
\noresetlinenumannotation@
\end{verbatim}

II.3.2 Options of reledmac

\begin{verbatim}
\DeclareOptionX{series}{A,B,C,D,E}{\xdef\default@series{#1}}
\ExecuteOptionsX{series}\
\newif\if@noeled@sec
\DeclareOptionX{noeledsec}{\@noeled@sectrue}
\newif\ifnocritical@
\DeclareOptionX{nocritical}{\nocritical@true}
\newif\ifnofamiliar@
\DeclareOptionX{nofamiliar}{\nofamiliar@true}
\newif\ifnoledgroup@
\DeclareOptionX{noledgroup}{\noledgroup@true}
\newif\ifnoend@
\DeclareOptionX{noend}{\let\l@dend@open\@gobble\let\l@dend@close\relax\global\let\l@dend@stuff=relax\noend@true
\end{verbatim}

II.3 Package options

\newif\ifnoquotation
\DeclareOptionX{noquotation}{\noquotation@true}
\newif\ifledfinal
\DeclareOptionX{final}{\ledfinaltrue}
\DeclareOptionX{draft}{\ledfinalfalse}
\ExecuteOptionsX{final}
\newif\ifparapparatus
\DeclareOptionX{parapparatus}{\parapparatus@true}
\newif\iflednopbinverse
\DeclareOptionX{nopbinverse}{\lednopbinverstrue}
\newif\ifwidthliketwocolumns
\DeclareOptionX{widthliketwocolumns}{\widthliketwocolumnstrue}
\newif\ifcontinuousnumberingwithcolumns
\DeclareOptionX{continuousnumberingwithcolumns}{\continuousnumberingwithcolumnstrue}
\newif\ifxindy
\DeclareOptionX{xindy}[eledmac-markup-attr.xdy]{%
\AtBeginDocument{\immediate\openout\eledmac@xindy@out=#1}%
\newwrite\eledmac@xindy@out%
\xindy@true%
\edef\eledmacmarkuplocrefdepth{\depth 1}%
\AtEndDocument{\immediate\closeout\eledmac@xindy@out}}%
\newif\ifxindyhyperref
\DeclareOptionX{xindy+hyperref}{\xindyhyperref@true}
\newif\ifeledmaccompat
\DeclareOptionX{eledmac-compat}{\eledmaccompat@true}
\def\l@auxdir{}
\DeclareOptionX{auxdir}{\xdef\l@auxdir{#1/}}
\newif\ifswcaseinsensitive
\DeclareOptionX{swcaseinsensitive}{%
\AtBeginDocument{\let\add@penalties\relax}%
\def\l@auxdir{}
\DeclareOptionX{nopenalties}{%
\AtBeginDocument{\let\add@penalties\relax}%
\def\l@auxdir{}}
\newif\ifswhelative
We use the starred form of \ProcessOptionsX which executes options in the order listed in the source file: class options, then listed package options, so a package option can override a class option with the same name. This was suggested by Dan Luecking in the ctt thread `Class/package option processing`, on 27 February 2004.

\ProcessOptionsX*\relax

\II.4 Loading packages

Loading package \texttt{xargs} to declare commands with optional arguments. Loading package \texttt{xparse} to declare fully expandable commands with optional argument. Ideally, we should use only \texttt{xparse} and not \texttt{xargs}. For historical reasons, we use both. \texttt{Etoolbox} is also used to make code clearer - for example, in dynamic command names (which can replace \texttt{\csname} etc.). Use \texttt{suffix} to declare commands with a starred version, \texttt{xstring} to work with strings, \texttt{ifluatex} and \texttt{ifxetex} to test if \LaTeX{} or \XeLaTeX{} is running, and \texttt{ragged2e} to manage ragged justification for paragraphed notes.

\RequirePackage{xargs}
\RequirePackage{xparse}[2017/03/07]
\RequirePackage{etoolbox}
@ifboolexpr{not test\@ifl@t@r\fmtversion{2016/03/31}} or (test\(\texttt{\ifdefstring}\fmtversion{2016/03/31}\) and test \(\texttt{\ifnumless}\\patch@level\{3}\)\}\
\PackageWarning{reledmac}{You are using a LaTeX version older than 2016/03/31 patch 3.\}
\MessageBreak You are strongly encouraged to use a newer version.)\%
(\}

II.8 Gobbling

Here, we define some commands which gobble their arguments.

\@gobblethree
\@gobblefour
\@gobbleseven

\providecommand*{\@gobblethree}[3]{}
\providecommand*{\@gobblefour}[4]{}
\providecommand*{\@gobbleseven}[7]{}

II.9 Wrapping content

The \l@wrap@ifnotemptybox macro wraps its second argument in the command passed as the first argument, but only if the second argument does not produce an empty box. That is useful for example when we need to wrap something on a superscript.

Indeed a\textsuperscript{}b does not produce the same typographical result as ab\textsuperscript{2}.

\newcommand{\l@wrap@ifnotemptybox}[2]{\setbox0=\hbox{#2}\ifdim\wd0=\z@\else\#1{#2}\fi}
\newcommand{\l@wrapcs@ifnotemptybox}[2]{\l@wrap@ifnotemptybox{\csname #1\endcsname}{#2}}

II.10 Miscellaneous commands

\showlemma\showlemma{\langle lemma\rangle} typesets the lemma text in the body. It depends on the option.

\ifledfinal\newcommand{\showlemma}[1]{#1}\else\newcommand{\showlemma}[1]{\underline{#1}}\fi

\linenumberlist The code for the \linenumberlist mechanism was given to Peter Wilson by Wayne Sullivan on 2004/02/11.

 Initialize it as \empty.

\footnote{Compare the distance between letters in the first case (ab) and in the second one (ab).}
In imitation of \TeX, we create a couple of scratch counters. \LaTeX already defines \@tempcnta and \@tempcntb but Peter Wilson found in the past that it can be dangerous to use these (for example one of the AMS packages did something nasty to the \texttt{ccaption} package’s use of one of these).

\begin{verbatim}
\let\linenumberlist=\empty
\end{verbatim}

\section*{II.11 Prepare \texttt{reledpar}}

In preparation for the \texttt{reledpar} package, these are related to the ‘right’ text of parallel texts (when \if@dpairing is TRUE). They are explained in the \texttt{reledpar} manual.

\begin{verbatim}
\newif\if@dpairing
\newif\if@dpaging
\newif\if@printingpages
\newif\if@printingcolumns
\newif\if@start
\newcount\@start
\if@dpairing
\if@dpaging
\if@printingpages
\if@printingcolumns
\if@start
\gdef\linenumberlist{\empty}
\end{verbatim}

\paragraph*{\texttt{\if@dpairing}} \texttt{\if@dpairing} is set to true in the \texttt{Rightside} environment. It must not be confused with \texttt{\if@dpairing} which is set to true when a right line is processed, in \texttt{\Pages} or \texttt{\Columns}.

\begin{verbatim}
\newif\if@start
\newif\if@dpairing
\newif\if@dpaging
\newif\if@printingpages
\newif\if@printingcolumns
\if@dpairing
\if@dpaging
\if@printingpages
\if@printingcolumns
\if@start
\gdef\linenumberlist{\empty}
\end{verbatim}

\paragraph*{\texttt{\if@start}} \texttt{\if@start} is set to true if we’re within a right text numbered section.

\begin{verbatim}
\newif\if@start
\end{verbatim}

\paragraph*{\texttt{\ifafterendnumberingR}} \texttt{\ifafterendnumberingR} boolean is set to TRUE at \texttt{\endnumberingR} and to FALSE at next \texttt{\beginnumberingR} or \texttt{\resumehighlight} (not \texttt{\resumehighlight}).

\begin{verbatim}
\newif\ifafterendnumberingR
\end{verbatim}

\paragraph*{\texttt{\ifXnote@}} \texttt{\ifXnote@} macro is set to true when we are typesetting a critical footnote.

\begin{verbatim}
\newif\ifXnote@
\end{verbatim}
II.12 Booleans provided by other optional packages which are required in any case

\texttt{\textbackslash ifindtl@innote}\texttt{\textbackslash ifindtl@notenumber}

The \texttt{\textbackslash ifindtl@innote} and \texttt{\textbackslash ifindtl@notenumber} are required even if \texttt{indextools} is not used.

\providebool{indtl@innote}
\providebool{indtl@notenumber}

III Sectioning commands

\texttt{\textbackslash section@num}

You use \texttt{\textbackslash beginnumbering} and \texttt{\textbackslash endnumbering} to begin and end a line-numbered section of the text; the pair of commands may be used as many times as you like within one document to start and end multiple, separately line-numbered sections. \LaTeX{} will maintain and display a 'section number' as a count named \texttt{\section@num} that counts how many \texttt{\beginnumbering} and \texttt{\resumenumbering} commands have appeared; it need not be related to the logical divisions of your text.

\texttt{\textbackslash extensionchars}

Each section will read and write an associated 'line-list file', containing information used to do the numbering; the file will be called \texttt{⟨jobname⟩.nn}, where \texttt{nn} is the section number. However, you may direct that an extra string be added before the \texttt{nn} in that filename, in order to distinguish these temporary files from others: that string is called \texttt{\extensionchars}. Initially it's empty, since different operating systems have greatly varying ideas about what characters are permitted in file names. So \texttt{\renewcommand{\extensionchars}{-}} gives temporary files called \texttt{jobname.-1}, \texttt{jobname.-2}, etc.

\texttt{\newcount\section@num}
\texttt{\section@num=0}
\texttt{\let\extensionchars=\empty}

\texttt{\ifnumbering}
\texttt{\numberingtrue}\texttt{\numberingfalse}

The \texttt{\ifnumbering} flag is set to \texttt{true} if we are within a numbered section (that is, between \texttt{\beginnumbering} and \texttt{\endnumbering}). You can use \texttt{\ifnumbering} in your own code to check whether you are in a numbered section, but do not change the flag's value.

\texttt{\beginnumbering}\texttt{\initnumbering@reg}

\texttt{\beginnumbering} begins a section of numbered text. When it is executed we increment the section number, initialize our counters, send a message to your terminal, and call macros to start the lineation machinery and endnote files.

The initializations here are trickier than they look. \texttt{\line@list@stuff} will use all of the counters that are zeroed here when it assembles the line-list and other lists of information about the lineation. But it will do all of this locally and within a group, and
when it is done the lists will remain but the counters will return to zero. Those same counters will then be used as we process the text of this section, but the assignments will be made globally. These initializations actually apply to both uses, though in all other respects there should be no direct interaction between the use of these counters and variables in the two processing steps. For parallel processing:

- zero `\@dnumpstartsL` — the number of chunks to be processed.
- set `\ifpstd@tedL` to `FALSE`.

The tools for section’s title commands are called:

- Define an empty list of `pstart` number where sectioning commands are called.
- Input auxiliary `\f_ile` with the description of section titles.
- Open the same auxiliary `\f_ile` to write in.
\endnumbering must follow the last text for a numbered section. It takes care of notifying you when changes have been noted in the input that require running the file
Sectioning commands

through again to move everything to the right place. We define it using \def and not \newcommand because \LaTeX{} does not allow defining command whose name starts by “end” except if we are currently creating an environment, which is not the case here.

\def\endnumbering{%
  \ifnumbering
    \global\numberingfalse
    \normal@pars
    \ifnum\l@dnumpstartsL=0%
      \led@err@NumberingWithoutPstart%
    \fi%
  \%
}

For the continuousnumberingwithcolumn options, we need to store a global value for the next \endnumbering. We don’t modify this counter globally, because that creates problem for nested \edtext.

\global\page@num=\this@section@page@num%
\global\last@page@num=\this@section@last@page@num%

\fi

The \pausenumbering macro is just the same as \endnumbering, but with the ifnumbering flag set to true, to show that numbering continues across the gap.\footnote{Peter Wilson’s thanks to Wayne Sullivan, who suggested the idea behind these macros.}
The \resumenumbering macro is a bit more involved, but not much. It does most of the
same things as \beginnumbering, but without resetting the various counters. Note that
no check is made by \resumenumbering to ensure that \pausenumbering was actually
invoked. The boolean \ifresumenumbering@start is set to true. That allows us to
avoid resetting the line number at the first line of \resumenumbering if the lineation
is by page. This boolean is set to false after the first action.

IV List macros

We will make heavy use of lists of information, which will be built up and taken apart by the following macros; they are adapted from *The TeXbook*, pp. 378–379, which discusses their use in more detail.

These macros consume a large amount of the run-time of this code. We intend to replace them in a future version, and in anticipation of doing so have defined their interface in such a way that it is not sensitive to details of the underlying code.

The historical list tools of `ledmac` are kept, because in many cases there are more useful than `etoolbox`'s lists. They allow to get and delete the first element of a list in one operation. They also expand the items added to the list.

However, `etoolbox`'s lists are more useful to loop on them. Consequently, depending on what we need, we use one or either.

It could be nice to unify them to the `tikz` list, however such migration would take quite time with some risk of error, for a gain which will be minor.

\listcreate

The \listcreate macro creates a new list. This macro does not do anything beyond initializing an empty list macro.
The \list@clear macro just initializes a list to the empty list; it is no different from \list@create in its effect, but it is in its semantic.

\newcommand*{\list@clear}[1]{%

%

V Line counting

V.1 Choosing the system of lineation

Line number can be reset at each section (default) ; at each page ; at each pstart. Here we define internal codes for these systems and the macros.

The \ifbypage@ and \ifbypage@ flag specify the current lineation system:
• line-of-page: \ifbypage = false and \ifbypage = true.
• line-of-pstart: \ifbypstart = true and \ifbypage = false.

\reledmac will use the line-of-section system unless instructed otherwise.

The \ifbypage and \ifbypstart flag specify the current lineation for right side in case of using \reledpar. They are now defined because they are used in some specific code. \reledpar will use the line-of-section system unless instructed otherwise.

\lineation{(word)} is the macro you use to select the lineation system. Its argument is a string: either page, section or pstart.

If the argument is page.

If the argument is pstart.
And finally, if the argument is `section` (default).

In other case, it is an error.

---

**V.2 Line number margin**

\line-margin\linenum-margin\l@getline-margin\linenum-margin{⟨word⟩} specify which margin line numbers are in; it takes one argument, a string, which value can be `left`; `right`; `inner` or `outer`.

The selection is recorded in the count `\line-margin`: 0 for left, 1 for right, 2 for outer, and 3 for inner.
V.3 Line number initialization and increment

The following counters tell reledmac which lines should be printed with line numbers. firstlinenum is the number of the first line in each section that gets a number; linenumincrement is the difference between successive numbered lines. The initial values of these counters produce labels on lines 5, 10, 15, etc. linenumincrement must be at least 1.

\newcounter{firstlinenum}
\setcounter{firstlinenum}{5}
\newcounter{linenumincrement}
\setcounter{linenumincrement}{5}

The following parameters are just like firstlinenum and linenumincrement, but for sub-line numbers. sublinenumincrement must be at least 1.

\newcounter{firstsublinenum}
\setcounter{firstsublinenum}{5}
\newcounter{sublinenumincrement}
\setcounter{sublinenumincrement}{5}

These macros can be used to set the corresponding counters.

\newcommand*{\firstlinenum}{\protect\ifnum\thepage<5\relax\protect\onehalfspacing\else\protect\timespan\fi}
\firstlinenum{\protect\ifnum\thepage<5\relax\protect\onehalfspacing\else\protect\timespan\fi}

\newcommand*{\linenumincrement}{\protect\ifnum\thepage<5\relax\protect\onehalfspacing\else\protect\timespan\fi}
\linenumincrement{\protect\ifnum\thepage<5\relax\protect\onehalfspacing\else\protect\timespan\fi}

\newcommand*{\firstsublinenum}{\protect\ifnum\thepage<5\relax\protect\onehalfspacing\else\protect\timespan\fi}
\firstsublinenum{\protect\ifnum\thepage<5\relax\protect\onehalfspacing\else\protect\timespan\fi}

\newcommand*{\sublinenumincrement}{\protect\ifnum\thepage<5\relax\protect\onehalfspacing\else\protect\timespan\fi}
\sublinenumincrement{\protect\ifnum\thepage<5\relax\protect\onehalfspacing\else\protect\timespan\fi}
V.4  Line number locking

When line locking is being used, the \lockdisp{⟨word⟩} macro specifies whether a line number—if one is due to appear—should be printed on the first printed line or on the last, or by all of them. Its argument is a word, either first, last, or all. Initially, it is set to first.

\lockdisp encodes the selection: 0 for first, 1 for last, 2 for all.
The same questions about where to print the line number apply to sub-lines, and these
are the analogous macros for dealing with the problem.

\newcount\sublock@disp
\newcommand{\sublockdisp}[1]{{%}
  \l@dgetlock@disp{#1}%
  \ifnum\@l@dtempcntb>\m@ne
    \global\sublock@disp=\@l@dtempcntb
  \else
    \led@warn@BadSublockdisp
  \fi
}\fi
%
\subblockdisp \subblock@disp

V.5 Line number style
We provide a mechanism for using different representations of the line numbers, not
just the normal arabic.

\newcommand*{\linenumberstyle}[1]{{%}
  \def\linenumrep&#1{\@nameuse{@#1}{##1}}
}\newcommand*{\sublinenumberstyle}[1]{{%}
  \def\sublinenumrep&#1{\@nameuse{@#1}{##1}}
}\newcommand*{\linenumrep}{\@nameuse{@#1}{##1}}
\newcommand*{\sublinenumrep}{\@nameuse{@#1}{##1}}

Initialise the number styles to arabic.
V.6 Line number printing

\leftlinenum and \rightlinenum are the macros that are called to print marginal line numbers on a page, for left- and right-hand margins respectively. They are made easy to access and change, since you may want to change the styling in some way. These standard versions illustrate the general sort of thing that will be needed; they are based on the \leftheadline macro in The \TeXbook, p. 416.

Whatever these macros output gets printed in a box that will be put into the appropriate margin without any space between it and the line of text. You will generally want a kern between a line number and the text, and \linenumsep is provided as a standard way of storing its size. Line numbers are usually printed in a smaller font, and \numlabfont is provided as a standard name for that font. When called, these macros will be executed within a group, so font changes and the like will remain local.

\ledlinenum typesets the line (and subline) number.

The original \numlabfont specification is equivalent to the \TeX \scriptsize for a 10pt document.
V.7 Line number counters and lists

Footnote references using line numbers rather than symbols can’t be generated in one pass, because we do not know the line numbers till we ship out the pages. It would be possible if footnotes were never keyed to more than one line; but some footnotes gloss passages that may run for several lines, and they must be tied to the first line of the passage glossed. And even one-line passages require two passes if we want line-per-page numbering rather than line-per-section numbering.

So we run \LaTeX{} over the text several times, and each time save information about page and line numbers in a 'line-list file' to be used during the next pass. At the start of each section—whenever \beginnumbering is executed—the line-list file for that section is read, and the information from it is encoded into a few list macros.

We need \first to define the different line numbers that are involved in these macros, and the associated counters.

\line@num The count \line@num stores the line number that is used in marginal line numbering and in notes: counting either by section, page or pstart, depending on your choice for this section. This may be qualified by \subline@num.

\newcount\line@num
\%\newcount\line@num
\%

\subline@num The count \subline@num stores a sub-line number that qualifies \line@num. For example, line 10 might have sub-line numbers 1, 2 and 3, which might be printed as lines 10.1, 10.2, 10.3.

\newcount\subline@num
\%
\newcount\subline@num
\%

\\texttt{\ifsublines@ \sublines@true \sublines@false}\ We maintain an associated flag, \texttt{\ifsublines@}, to tell us whether we’re within a sub-line range or not.

You may wonder why we do not just use the value of \subline@num to determine this—treating anything greater than 0 as an indication that sub-lineation is on. We need
V.8 Line number locking counter

a separate flag because sub-lineation can be used together with line-number locking in odd ways: several pieces of a logical line might be interrupted by pieces of sub-lineated text, and those sub-line numbers should not return to zero until the next change in the major line number. This is common in the typesetting of English Renaissance verse drama, in which stage directions are given sub-line numbers: a single line of verse may be interrupted by several stage directions.

\newif\ifsublines@  
\%  
\absline@num The count \absline@num stores the absolute number of lines since the start of the section: that is, the number we have actually printed, no matter what numbers we attached to them. This value is never printed on an output page, though \line@num will often be equal to it. It is used internally to keep track of where notes are to appear and where new pages start: using this value rather than \line@num is a lot simpler, because it does not depend on the lineation system in use.

\newcount\absline@num  
\%  

We will call \absline@num numbers "absolute" numbers, and \line@num and \subline@num numbers "visible" numbers.

V.8 Line number locking counter

\@lock \sub@lock The counts \@lock and \sub@lock tell us the state of line-number and sub-line-number locking. 0 means we are not within a locked set of lines; 1 means we are at the first line in the set; 2, at some intermediate line; and 3, at the last line.

\newcount\@lock  
\newcount\sub@lock  
\%

V.9 Line number associated to lemma

Now we can define the list of macros which will be created from the line-list file. We will maintain the following lists:

- \line@list: the page and line numbers for every lemma marked by \edtext.

There are seven pieces of information, separated by vertical bars:

1. the starting page,
2. line, and
3. sub-line numbers, followed by the
4. ending page,
5. line, and
6. sub-line numbers, and then the
7. font specifier for the lemma.
These line numbers are all visible numbers. The font specifier is a set of four codes for font encoding, family, series, and shape, separated by / characters. Thus a lemma that started on page 23, line 35 and went on until page 24, line 3 (with no sub-line numbering), and was typeset in a normal roman font would have a line list entry like this:

23|35|0|24|3|0|OT1/cmr/m/n.

There is one item in this list for every lemma marked by \edtext, even if there are several notes to that lemma, or no notes at all. \edtext reads the data in this list, making it available for use in the text of notes.

- \insertlines@list: the line numbers of lines that have footnotes or other insertions. These are the absolute numbers where the corresponding lemmas begin. This list contains one entry for every footnote in the section; one lemma may contribute no footnotes or many footnotes. This list is used by \add@inserts within \do@line, to tell it where to insert notes.

- \actionlines@list: a list of absolute line numbers at which we are to perform special actions; these actions are specified by the \actions@list list defined below.

- \actions@list: action codes corresponding to the line numbers in \actionlines@list. These codes tell reledmac what action it is supposed to take at each of these lines. One action, the page-start action, is generated behind the scenes by reledmac itself; the others, for specifying sub-lineation, line-number locking, and line-number alteration, are generated only by explicit commands in your input file. The page-start and line-number-alteration actions require arguments, to specify the new values for the page or line numbers; instead of storing those arguments in another list, we have chosen the action-code values so that they can encode both the action and the argument in these cases. Action codes greater than \(-1000\) are page-start actions, and the code value is the page number; action codes less than \(-5000\) specify line numbers, and the code value is a transformed version of the line number; action codes between these two values specify other actions which require no argument.

Here is the full list of action codes and their meanings:

Any number greater than \(-1000\) is a page-start action: the line number associated with it is the first line on a page, and the action number is the page number. (The cutoff of \(-1000\) is chosen because negative page-number values are used by some macro packages; we assume that page-number values less than \(-1000\) are not common.) Page-start action codes are added to the list by the \page@action macro, which is (indirectly) triggered by the workings of the \page@start macro; that macro should always be called in the output routine, just before the page contents are assembled. Eledmac calls it in \pagecontents.

The action code \(-1001\) specifies the start of sub-lineation: meaning that, starting with the next line, we should be advancing \subline@num at each start-of-line command, rather than \line@num.

The action code \(-1002\) specifies the end of sub-lineation. At the next start-of-line, we should clear the sub-line counter and start advancing the line number.
The action codes for starting and ending sub-lineation are added to the list by the \sub@action macro, as called to implement the \startsub and \endsub macros.

The action code \hbox{−1003} specifies the start of line number locking. After the number for the current line is computed, it will remain at that value through the next line that has an action code to end locking.

The action code \hbox{−1004} specifies the end of line number locking.

The action code \hbox{−1005} specifies the start of sub-line number locking. After the number for the current sub-line is computed, it will remain at that value through the next sub-line that has an action code to end locking.

The action code \hbox{−1006} specifies the end of sub-line number locking.

The four action codes for line and sub-line number locking are added to the list by the \do@lockon and \do@lockoff macros, as called to implement the \startlock and \endlock macros.

An action code of \hbox{−5000} or less sets the current visible line number (either the line number or the sub-line number, whichever is currently being advanced) to a specific positive value. The value of the code is \hbox{−(5000 + n)}, where \hbox{n} is the value (always \hbox{≥ 0}) assigned to the current line number. Action codes of this type are added to the list by the \set@line@action macro, as called to implement the \advanceline and \setline macros: this action only occurs when the user has specified some change to the line numbers using those macros. Normally \reledmac computes the visible line numbers from the absolute line numbers with reference to the other action codes and the settings they invoke; it does not require an entry in the action-code list for every line.

• \annot@list stores line number annotations for the start and the end lines of each \edtext, as \line@list does for line numbers. We don’t store that in the same list as line numbers as \Xprintlines already have height arguments, and a \TeX macro can take at most nine arguments.

Here are the commands to create these lists:

\begin{verbatim}
\list@create{\line@list}
\list@create{\insertlines@list}
\list@create{\actionlines@list}
\list@create{\actions@list}
\list@create{\annot@list}\
\end{verbatim}

\begin{verbatim}
\page@num
\endpage@num
\endline@num
\endsubline@num
\nevcnt\page@num
\nevcnt\endpage@num
\nevcnt\endline@num
\nevcnt\endsubline@num
\end{verbatim}

We will need some counts while we read the line-list, for the page number and the ending page, line, and sub-line numbers. Some of these will be used again later on, when we are acting on the data in our list macros.
\this@section@page@num

The \this@section@page@num stores the page number on which a numbering section ends.

\newcount\this@section@page@num\%
%

\ifnoteschanged@
\noteschanged@true
\noteschanged@false

If the number of the footnotes in a section is different from what it was during the last run, or if this is the very first time you’ve run \LaTeX, on this file, the information from the line-list used to place the notes will be wrong, and some notes will probably be misplaced. When this happens, we prefer to give a single error message for the whole section rather than messages at every point where we notice the problem, because we do not really know where in the section notes were added or removed, and the solution in any case is simply to run \LaTeX two more times; there is no fix needed to the document. The \ifnoteschanged@ flag is set if such a change in the number of notes is discovered at any point.

\newif\ifnoteschanged@
%

\resetprevline@

Inside the apparatus, at each note, the line number is stored in a macro called \prevlineX, where X is the letter of the current series. This macro is called when using \Xnumberonlyfirstinline. This macro must be reset at the same time as the line number. The \resetprevline@ does this resetting for every series.

\resetprevline@\newcommand*{\resetprevline@}{%\%
\def\do##1{\global\csundef{prevline##1}}%

}
V.10 Reading the line-list file

\read@linelist\read@linelist{⟨/f_ile⟩} is the control sequence that is called by \beginnumbering (via \line@list@stuff) to open and process a line-list file; its argument is the name of the file. First, it clears all previous line's list.

\newread\@inputcheck
\newcommand*{\read@linelist}[1]{%
    \ifledRcol%
    \list@clearing@regR%
    \else%
    \list@clearing@reg%
    \fi%
%
    When using reledpar, make sure that the \maxlinesinpar@list is empty (otherwise things will be thrown out of kilter if there is any old stuff still hanging in there).

    \list@clear{\maxlinesinpar@list}
%
    Now get the file and interpret it. When the file is there we start a new group and make some special definitions we will need to process it. It is a sequence of \TeX commands, but they require a few special settings. We make \[ and \] become grouping characters: they are used that way in the line-list file, because we need to write them out one at a time rather than in balanced pairs, and it is easier to just use something other than real braces. \@ must be made a letter, since this is run in the ordinary \LaTeX context. We ignore carriage returns, since if we are in horizontal mode they can get interpreted as spaces to be printed.

    Our line, page, and line-locking counters were already zeroed by \line@list@stuff if this is being called from within \beginnumbering; sub-lineation will be turned off as well in that case. On the other hand, if this is being called from \resumenumbering, those things should still have the values they had when \pausenumbering was executed.

    If the file is not there, we print an informative message.

    Now, after these preliminaries, we start interpreting the file.

When the reading is done, we are all through with the line-list file. All the information we needed from it will now be encoded in our list macros.

Finally, we initialize the \next@actionline and \next@action macros, which specify where and what the next action to be taken is.

\list@clearing@reg Clear the lists for \read@linelist

\get@linelistfile reledmac can take advantage of the \TeX{} ‘safe file input’ macros to get the line-list file.
This version of \read@linelist creates list macros containing data for the entire section, so they could get rather large. It would be no more difficult to read the line-list file incrementally rather than all at once: we could read, at the start of each paragraph, only the commands relating to that paragraph. But this would require that we have two line-lists open at once, one for reading, one for writing, and on systems without version numbers we would have to do some file renaming outside of \TeX for that to work. We have retained this slower approach to avoid that sort of hacking about, but have provided the \pausenumbering and \resumenumbering macros to help you if you run into macro memory limitations (see 5.2.7 p. 20 above).

V.11 Commands within the line-list file

This section defines the commands that can appear within a line-list file. They all have very short names because we are likely to be writing very large numbers of them out. One macro, \@nl, is especially short, since it will be written to the line-list file once for every line of text in a numbered section. (Another of these commands, \@lab, will be introduced in a later section, among the cross-referencing commands it is associated with.)

When these commands modify the various page and line counters, they deliberately do not use \global. This is because we want them to affect only the counter values within the current group when nested calls of \@ref occur. (The code assumes throughout that the value of \globaldefs is zero.)

The macros with action in their names contain all the code that modifies the action-code list: again, this is so that they can be turned off easily for nested calls of \@ref.

\line@list@version

The \line@list@version check if the line-list file does not refers to the older commands of \reledmac. In this case, we stop reading the line-list file. Consequently, \line@list@version must be the first line of a line-number file.
\@nl \@nl\reg 
\@nl does everything related to the start of a new line of numbered text.
In order to get the \setlinenum to work Peter Wilson had to slip in some new code at the start of the macro, to get the timing of the actions correct. The problem was that his original naive implementation of \setlinenum had an unfortunate tendency to change the number of the last line of the preceding paragraph. The new code is sort of based on the page number handling and \setline. It seems that a lot of fiddling with the line number internals is required.

In November 2004 in order to accurately determine page numbers Peter Wilson added these to the macro. It is now:
\@nl\{(page counter number)\}\{(printed page number)\}
We do not (yet) use the printed number (i.e., the \thepage) but it may come in handy later. The macro \@page checks if a new page has started.

Exactly what \@nl does depends on whether right text is being processed. That’s why many code is defined in \@nl\reg or \nl\regR.

\begin{verbatim}
\newcommand*{\@nl}[2]{
\@page{#1}\
\ifledRcol\
\@nl\regR\
\else\
\@nl\reg\
\fi\
}
\newcommand*{\@nl\reg}{\ifx\l@dchset@num\relax \else
\advance\absline@num \@ne

\ifx\sub@change\relax \else
\ifnum\sub@change>\z@\sublines@true\else\sublines@false\fi
\end{verbatim}

First increment the absolute line-number, and perform deferred actions relating to page starts and sub-lines.
Fix the lock counters, if necessary. A value of 1 is advanced to 2; 3 advances to 0; other values are unchanged.

Now advance the visible line number, unless it has been locked.
And we set a flag that tells \@nl that a new page number is to be set, because other associated actions shouldn’t occur until the next line-start occurs.
\@pend These do not do anything at this point, but will have been added to the auxiliary file(s) if the \reledpar package has been used. They are just here to stop \reledmac from moaning if the \reledpar is used for one run and then not for the following one.

\@pend\@pendR \@lopL \@lopR

\newcommand*{\@pend}{1}\newcommand*{\@pendR}{1}\newcommand*{\@lopL}{1}\newcommand*{\@lopR}{1}

\%\sub@on\sub@off The \sub@on and \sub@off macros turn sub-lineation on and off: but not directly, since such changes do not really take effect until the next line of text. Instead they set a flag that notifies \@nl of the necessary action.

\newcommand*{\sub@on}{\ifsublines@\let\sub@change=\relax\else\def\sub@change{1}%;\fi} \newcommand*{\sub@off}{\ifsublines@\def\sub@change{-1}%;\else\let\sub@change=\relax;\fi} \%

\end{verbatim}
\texttt{\lock@on} adds an entry to the action-code list to turn line number locking on. The current setting of the sub-lineation flag tells us whether this applies to line numbers or sub-line numbers.

Adding commands to the action list is slow, and it is very often the case that a lock-on command is immediately followed by a lock-off command in the line-list file, and therefore really does nothing. We use a look-ahead scheme here to detect such pairs, and add nothing to the line-list in those cases.

\@ref \insert@count \@ref marks the start of a passage, for creation of a footnote reference. It takes two arguments:

  • \#1, the number of entries to add to \insertlines@list for this reference. This value, here and within \edtext, which computes it and writes it to the line-list file, will be stored in the count \insert@count.
\end{verbatim}
• #2, a sequence of other line-list-file commands, executed to determine the ending line-number. (This may also include other \@ref commands, corresponding to uses of \edtext within the first argument of another instance of \edtext.)

\dummy@ref \textbf{When nesting of \@ref commands does occur, it is necessary to temporarily redefine \@ref within \@ref, so that we are only doing one of these at a time.}

\newcommand*{\dummy@ref}[2]{#2}

\@ref\reg \textbf{The first thing \@ref (i.e. \@ref\reg) itself does is to add the specified number of items to the \insertlines@list list.}

\newcommand*{\@ref\reg}[2]{% 
\ifledRcol% 
\@ref@regR{#1}{#2}% 
\else% 
\@ref@reg{#1}{#2}% 
\fi% 
}

\newcommand*{\@ref@reg}[2]{% 
\global\insert@count=#1\relax 
\global\advance\@edtext@level by 1% 
\loop\ifnum\insert@count>\z@ 
\xright@appenditem{\the\absline@num}to\insertlines@list 
\global\advance\insert@count \m@ne 
\repeat 
%}

Next, process the second argument to determine the page and line numbers for the end of this lemma. We temporarily equate \@ref to a different macro that just executes its argument, so that nested \@ref commands are just skipped this time. Some other macros need to be temporarily redefined to suppress their action.

\begingroup
\let\@ref=\dummy@ref 
\let\@lopL\@gobble

\let\store@annot@to@absline\@gobble\% #2
\global\endpage@num=\page@num 
\global\endline@num=\line@num
\endgroup
Now store all the information about the location of the lemma’s start and end in \line@list.

And now, call \@ref@reg@parsearg, which can be also called by \@ref@later

Decrease edtext level counter.

\@ref@reg@parse The \@ref@reg@parsearg command parses the second argument of a \@ref or the unique argument of \@ref@later written in the auxiliary /f_ill.

First, create a list which stores every second argument of each \@sw in this lemma, at this level. Also set the boolean about the use of lemma in this edtext level to false.

Execute the second argument of \@ref again, to perform for real all the commands within it.

Now, we store the list of \@sw of this current edtext as an element of the global list of list of \@sw for a edtext depth.
This macro is stored in the auxiliary file when using \edtextlater. It is used only to get the correct value for the \sameword tools.

\newcommand{\@ref@later}{[1]}{%
  \global\advance\@edtext@level by \@one%

}%

\ref@reg@later

V.12 Writing to the line-list file

We have now defined all the counters, lists, and commands involved in reading the line-list file at the start of a section. Now we will cover the commands that reledmac uses within the text of a section to write commands out to the line-list.

\linenum@out

The file will be opened on output stream \linenum@out.

\newwrite\linenum@out

\iffirst\linenum@out\first\linenum@out@true
\first\linenum@out@false

Once any file is opened on this stream, we keep it open forever, or else switch to another file that we keep open. The reason is that we want the output routine to write the page number for every page to this file; otherwise we would have to write it at the start of every line. But it is not very easy for the output routine to tell whether an output stream is open or not. There is no way to test the status of a particular output stream directly, and the asynchronous nature of output routines makes the status hard to determine by other means.

We can manage pretty well by means of the \iffirst\linenum@out@ flag; its inelegant name suggests the nature of the problem that made its creation necessary. It is set to be true before any \linenum@out file is opened. When such a file is opened for the first time, it is done using \immediate, so that it will at once be safe for the output routine to write to it; we then set this flag to false.
Writing to the line-list file

The commands allowed in the line-list file and their arguments can change between two versions of reledmac. The `\this@line@list@version` command is upgraded when it happens. It is written in the file list. If we process a line-list file which used an older version, that means the commands used inside are deprecated, and we can’t use them.

\newcommand{\this@line@list@version}{7}

The `\line@list@stuff` macro, which is called by `\beginnumbering`, performs all the line-list operations needed at the start of a section. Its argument is the name of the line-list file.

\let\next@line@list@stuff\relax
\newcommand*{\line@list@stuff}[1]{

First, define a toggle set to true when we are not in the first run.

\global\newtoggle{notfirstrun@#1}
\IfFileExists{\l@auxdir#1}{\global\toggletrue{notfirstrun@#1}}{\global\togglefalse{notfirstrun@#1}}

A internal hook (not used yet).
\next@line@list@stuff
\global\let\next@line@list@stuff\relax

Use the commands of the previous section to interpret the line-list file from the last run.
\read@linelist{#1}

Now close the current output line-list file, if any, and open a new one. The first time we open a line-list file for output, we do it using `\immediate`, and clear the `\iffirst@linenum@out@` flag. `reledmac` and `reledpar` can fill the `\next@line@list@stuff` hook between a `\endnumbering` (associated with numbered file \textit{n}) and a `\beginnumbering` (associated with numbered file \textit{n} + 1). It allows adding content to the numbered file \textit{n} + 1 and not \textit{n}.

\iffirst@linenum@out@
\global\first@linenum@out@false
\immediate\openout\linenum@out=\l@auxdir#1\relax
\immediate\write\linenum@out={\string\line@list@version{\this@line@list@version}}
\ife@dpaging
\newcommand*{\new@line}{%  
\set@this@c@page%  
\ifnumberline%  \IfStrEq{\led@pb@setting}{after}% {\xifinlist{\the\absline@num}{\l@prev@nopb}% {\xifinlist{\the\absline@num}{\normal@page@break}% {\numgdef{\@next@page}{\c@par@page+\@ne}%}}}% \fi% }%}

The new@line macro sends the \@nl command to the line-list file, to mark the start of a new text line, and its page number. It writes the two forms of the page number:

- Raw form (\the\c@page, which can be used for numeric tests.
- Formatted form (for example, in Roman).

Actually, only the first form is used by \@nl. If we use the \sameparallelpagenumber option of reledpar, we must write not the real page number (i.e. page counter, defined in standard \LaTeX) but the printed page number (i.e \par@page counter, defined only on reledmac).

- For the raw form, we use \the\c@page@page macro, because the \par@page counter is increased for each page.
- For the formatted version, \thepage is patched through \par@patch@thepage. So we have nothing to change.
\write\linenum@out{\string\@nl[\the\@this@c@page]\[\thepage]\}}%}

\IfStrEq\{\led@pb@setting\}{before}{%
{\numdef\{\next@absline\}\{\the\absline@num+\one\}%

{\IfStrEqCase\{\led@pb@setting\}{%
{\relax}{%
{\relax}{%
\write\linenum@out{\string\@nl[\the\@this@c@page]\[\thepage]\}%
}fi%}
}\newcount\@this@c@page%%
\newcommand\{\set@this@c@page\}{%
\ifboolexpr{bool{sameparallelpagenumber} or bool{prevpnotnumbered}}%
{\global\@this@c@page=\c@par@page}%
{\global\@this@c@page=\c@page}%
}\flag@start We enclose a lemma marked by edtext in flag@start and flag@end; these send the \@ref command to the line-list file. edtext is responsible for setting the value of \insert@count appropriately; it actually gets done by the various footnote macros.
\flag@end
With XeLaTeX, there is a problem when using RTL: the writing of a command in the numbered auxiliary files (.1, .2 etc) is reversed when the first argument of `\edtext` is typset in one line, but it is not reversed when this first argument is typset in two lines or more.

To solve this problem, we use a crossref mechanism. At the first run, we put a label, but we do not write any `@ref` command. When the value of the label can be tested, that is after three runs, we’re doing:

- If the first argument of `\edtext` is typset on only one line, we first call `flag@end`, at the point we normally call `flag@start`, at the beginning of the content of the first argument, and we call `flag@end` at the point we normally call `flag@start`, at the end of the content of the first argument.
- If the first argument of `\edtext` is typset on only two lines, we use the normal order.

\footnote{This problem is caused by the way XeLaTeX manages right-to-left typsetting. David Carlisle explains it on \url{http://tex.stackexchange.com/a/333373/7712} and provides a potential solution, using `\vadjust`. However in some cases this adds spurious vertical spaces in reledmac. That is why we are using the solution explained below.}
V.12 Writing to the line-list file

This system is a workaround for the problem of order when writing in auxiliary files. The \flag@start@RTL and \flag@end@RTL macro put the label, do the test and call the right commands.

\ \newcommand{\flag@start@RTL}{\%\edlabel{edtext:start:\csuse{thisedtext@the\@edtext@level}}\%\IfStrEq{\xabslineref{edtext:start:\csuse{thisedtext@the\@edtext@level}}}{}{\ifnumequal{\xabslineref{edtext:start:\csuse{thisedtext@the\@edtext@level}}}{\xabslineref{edtext:end:\csuse{thisedtext@the\@edtext@level}}}{\flag@end}{\flag@start}}\%}
\newcommand{\flag@end@RTL}{\%\edlabel{edtext:end:\csuse{thisedtext@the\@edtext@level}}\%\IfStrEq{\xabslineref{edtext:start:\csuse{thisedtext@the\@edtext@level}}}{}{\ifnumequal{\xabslineref{edtext:start:\csuse{thisedtext@the\@edtext@level}}}{\xabslineref{edtext:end:\csuse{thisedtext@the\@edtext@level}}}{\flag@start}{\flag@end}}\%}

\flag@start@later \flag@end@later: these send the \@ref@later to the line-list file command to the line-list file

\newcommand{\flag@start@later}{\%\ifledRcol\write\linenum@outR{\string\@ref@later[}\%\else\write\linenum@out{\string\@ref@later[}\%\fi\%}
\newcommand{\flag@end@later}{\%\ifledRcol\write\linenum@outR{]}\%\else\write\linenum@out{]}\%}
\startsub \endsub turn sub-lineation on and off, by writing appropriate instructions to the line-list file. When sub-lineation is in effect, the line number counter is frozen and the sub-line counter advances instead. If one of these commands appears in the middle of a line, it does not take effect until the next line; in other words, a line is counted as a line or sub-line depending on what it started out as, even if that changes in the middle.

We tinker with \lastskip because a command of either sort really needs to be attached to the last word preceding the change, not the first word that follows the change. This is because sub-lineation will often turn on and off in mid-line—stage directions, for example, often are mixed with dialogue in that way—and when a line is mixed we want to label it using the system that was in effect at its start. But when sub-lineation begins at the very start of a line we have a problem, if we don’t put in this code.

\newcommand*{\startsub}{\dimen0\lastskip
\ifdim\dimen0>0pt \unskip \fi
\ifledRcol \write\linenum@outR{\string\sub@on}\%
\else \write\linenum@out{\string\sub@on}\%
\fi
\fi
\ifdim\dimen0>0pt \hskip\dimen0 \fi}
def\endsub{\dimen0\lastskip
\ifdim\dimen0>0pt \unskip \fi
\ifledRcol \write\linenum@outR{\string\sub@off}\%
\else \write\linenum@out{\string\sub@off}\%
\fi
\fi
\ifdim\dimen0>0pt \hskip\dimen0 \fi}
\advanceline You can use \advanceline{⟨num⟩} in running text to advance the current visible line-number by a specified value, positive or negative.
\newcommand*{\advanceline}{1}{\leavevmode%
\ifledRcol \write\linenum@outR{\string\@adv[#1]}\%
\else \write\linenum@out{\string\@adv[#1]}\%
\fi%
}
\setline You can use \setline{⟨num⟩} in running text (i.e., within \pstart...\pend) to set the current visible line-number to a specified positive value.
\newcommand*{\setline}{1}{%
You can use `\setlinenum{⟨num⟩}` before a `\pstart` to set the visible line-number to a specified positive value. It writes a `\l@d@set` command to the line-list file.

You can use `\startlock` or `\endlock` in running text to start or end line number locking at the current line. They decide whether line numbers or sub-line numbers are affected, depending on the current state of the sub-lineation flags.

In numbered text `\skipnumbering` will suspend the numbering for that particular line.
VI  Marking text for notes

The \texttt{edtext} macro is used to create all footnotes and endnotes, as well as to print the portion of the main text to which a given note or notes is keyed. The idea is to have that lemma appear only once in the .tex file: all instances of it in the main text and in the notes are copied from that one appearance.

The \texttt{edtext} macro takes two arguments.

\texttt{edtext}\{#1\}{#2}

- #1 is the piece of the main text being glossed; it gets added to the main text, and is also used as a lemma for notes to it.
- #2 is a series of subsidiary macros that generate various kinds of notes.

The \texttt{edtext} macro may be used (somewhat) recursively; that is, \texttt{edtext} may be used within its own first argument. The code would be much simpler without this feature, but nested notes will commonly be necessary: it is quite likely that we will have an explanatory note for a long passage and notes on variants for individual words within that passage. The situation we can’t handle is overlapping notes that are not nested: for example, one note covering lines 10–15, and another covering 12–18. You can handle such cases by using the \texttt{lemma} and \texttt{linenum} macros within #2: they alter the copy of the lemma and the line numbers that are passed to the notes, and hence allow you to overcome any limitations of this system, albeit with extra effort.

The recursive operation of \texttt{edtext} will fail if you try to use a copy that is called something other than \texttt{edtext}. In order to handle recursion, \texttt{edtext} needs to redefine its own definition temporarily at one point, and that does not work if the macro you are calling is not actually named \texttt{edtext}. There is no problem as long as \texttt{edtext} is not
invoked in the first argument. If you want to call \edtext something else, it is best
to create instead a macro that expands to an invocation of \edtext, rather than copy-
ing \edtext and giving it a new name; otherwise you will need to add an appropriate
definition for your new macro to \morenoexpands.

Side-effects of our line-numbering code make it impossible to use the usual foot-
note macros directly within a paragraph whose lines are numbered (see comments to
\do@line, VII.2.1 p. 160). Instead, the appropriate note-generating command is ap-
pended to the list macro \inserts@list, and when \pend completes the paragraph it
inserts all the notes at the proper places.

Note that we do not provide previous-note information, although it is often wanted;
your own macros must handle that. We can not do it correctly without keeping track
of what kind of notes have gone past: it is not just a matter of remembering the line
numbers associated with the previous invocation of \edtext, because that might have
been for a different kind of note. It is preferable for your footnote macros to store and
recall this kind of information if they need it.

\textbf{VI.1 \edtext itself}

The various note-generating macros might want to request that commands be executed
not at once, but in close connection with the start or end of the lemma. For example,
footnote numbers in the text should be connected to the end of the lemma; or, instead
of a single macro to create a note listing variants, you might want to use several macros
in series to create individual variants, which would each add information to a private
macro or token register, which in turn would be formatted and output when all of #2
for the lemma has been read.

\list@create{\end@lemmas}
%\end@lemmas

We now need to define a number of macros that allow us to weed out nested instances
of \edtext, and other problematic macros, from our lemma. This is similar to what we
did in reading the line-list file using \dummy@ref and various redefinitions—and that is because
\edtext macros create nested @ref entries in the line-list file.

\newcommand{\dummy@edtext}{[2]{#1}}% 

\dummy@edtext@showlemma
Some time, we want to obtain only the first argument of \edtext, while also wrapping it in \showlemma. For example, when printing a \eledsection.

\newcommand{\dummy@edtext@showlemma}{[2]{\showlemma{#1}}}%

We are going to need another macro that takes one argument and ignores it entirely. This is supplied by the L\A\TEX\@gobble{⟨arg⟩}.

We need to turn off macro expansion for certain sorts of macros we are likely to see within the lemma and within the notes.

The first class is font-changing macros. We suppress expansion for them by letting them become equal to zero\footnote{Since ‘control sequences equivalent to characters are not expandable’—The \TeXbook, answer to Exercise 20.14.}.

This is done because we want to pass into our notes the generic commands to change to roman or whatever, and not their expansions that will ask for a particular style at a specified size. The notes may well be in a smaller font, so the command should be expanded later, when the note’s environment is in effect.

A second sort to turn off includes a few of the accent macros. Most are not a problem: an accent that is expanded to an \accent command may be harder to read but it works just the same. The ones that cause problems are: those that use alignments—\TeX seems to get confused about the difference between alignment parameters and macro parameters; those that use temporary control sequences; and those that look carefully at what the current font is.

(The \copyright macro defined in Plain \TeX has this sort of problem as well, but is not used enough to bother with. That macro, and any other that causes trouble, will get by all right if you put a \protect in front of it in your file.)

We also need to eliminate all reledmac macros like \edlabel and \setline that write things to auxiliary files: that writing should be done only once. And we make \edtext itself, if it appears within its own argument, do nothing but copy its first argument.

Finally, we execute \morenoexpands. The version of \morenoexpands defined here does nothing; but you may define a version of your own when you need to add more expansion suppressions as needed with your macros. That makes it possible to make such additions without needing to copy or modify the standard reledmac code. If you define your own \morenoexpands, you must be very careful about spaces: if the macro adds any spaces to the text when it runs, extra space will appear in the main text when \edtext is used.

The \new@series command also adds \let\footnote{⟨X⟩}\@gobble to the end of the \noexpands macro for the series ⟨X⟩.
VI.1 \edtext itself

(A related problem, not addressed by these two macros, is that of characters whose category code are changed by any of the macros used in the arguments to \edtext. Since the category codes are set when the arguments are scanned, macros that depend on changing them will not work. We have most often encountered this with characters that are made ‘active’ within text in some, but not all, of the languages used within the document. One way around the problem, if it takes this form, is to ensure that those characters are always active. Within languages that make no special use of them, their associated control sequences should simply return the proper character. A simpler solution is to avoid active characters, using LuaTEX or XeTEX.)

\ifnumberedpar%

Check the content of the arguments, to be certain there is no forbidden command inside.
\@check@edtext@args{#1}{#2}%

We increment the \@edtext@level \TeX{} counter to know in which level of \edtext we are.
\global\advance\@edtext@level by 1%

We also increase the \edtext \TeX{} counter to insert a hypertarget if the \hyperref package is loaded, and also works with \edtext on right-to-left typesetting with \XeLaTeX.

We store the value for the current level in a global macro. So we have one macro by level of \edtext. That is required, because \edtext can contain \edtext.
\global\advance\@edtext@level by 1%
\csxdef{thisedtext@\the\@edtext@level}{\theedtext}%

By default, we do not use \lemma
\global\@lemmacommand@false%
\begingroup%

We get the next series of samewords data in the list of samewords data for the current edtext level. We push them inside \sw@inthisedtext.
\ifledRcol%
  \ifsvoid{\sw@list@edtextR@\the\@edtext@level}{}
  \expandafter\gl@p\csname sw@list@edtextR@\the\@edtext@level\endcsname{to}\sw@inthisedtext}%
\else%
  \ifsvoid{\sw@list@edtext@\the\@edtext@level}{}
  \expandafter\gl@p\csname sw@list@edtext@\the\@edtext@level\endcsname{to}\sw@inthisedtext}%
\endgroup%
\edtext itself

Our normal lemma is just argument \#1; but that argument could have further invocations of \edtext within it. We get a copy of the lemma without any \edtext macros within it by temporarily redefining \edtext to just copy its first argument and ignore the other, and then expand \#1 into @tag, our lemma.

This is done within a group that starts here, in order to get the original \edtext restored; within this group we have also turned off the expansion of those control sequences commonly found within text that can cause trouble for us.

\global\renewcommand{\@tag}{% 
  \no@expands #1% 
}%

Prepare more data for the benefit of note-generating macros: the line references and font specifier for this lemma go to \l@d@nums.

\insert@count will be altered by the note-generating macros: it counts the number of deferred footnotes or other insertions generated by this instance of \edtext. If we are in a right column (reledpar), we use \insert@countR instead of \insert@count.

\ifledRcol \global\insert@countR \z@% \else \global\insert@count \z@ \fi%

Now process the note-generating macros in argument \#2 (i.e., \Afootnote, \lemma, etc.). \ignorespaces is here to skip over any spaces that might appear at the start of \#2; otherwise they wind up in the main text. Footnote and other macros that are used within \#2 should all end with \ignorespaces as well, to skip any spaces between macros when several are used in series.

\@edtext@secondarg@true%
\ignorespaces #2\relax
\@edtext@secondarg@false%

With X\LaTeX, you must track whether the language reads left to right (English) or right to left (Arabic). reledmac defines an \if@RTL boolean test is not already defined.

\if@RTL% 
  \flag@start@RTL% 
\else% 
  \flag@start%
\fi%

\fi%
We write in the numbered file whether the current \texttt{edtext} has a \texttt{lemma} in the second argument.

\begin{verbatim}
\if@lemmacommand@%
  \ifledRcol%
    \write\linenum@outR{\string\@lemma}%
  \else%
    \write\linenum@out{\string\@lemma}%
  \fi%
\fi%
\endgroup%
\ifdef{\hypertarget}{%
  \Hy@raisedlink@left{\hypertarget{\csuse{thisedtext@the} edtext@level}:start}{}%  \showlemma{#1}%
  \Hy@raisedlink{\hypertarget{\csuse{thisedtext@the} edtext@level}:end}{}%}
\else%
  \showlemma{#1}%
\fi%
\endverbatim

Finally, we are ready to admit the first argument into the current paragraph.

It is important that we generate and output all the notes for this chunk of text \textit{before} putting the text into the paragraph: notes that are referenced by line number should generally be tied to the start of the passage they gloss, not the end. That should all be done within the expansion of \texttt{#2} above, or in \texttt{aftergroup} commands within that expansion.

\begin{verbatim}
\endgroup%
\ifdef{\hypertarget}{%
  \Hy@raisedlink@left{\hypertarget{\csuse{thisedtext@the} edtext@level}:start}{}%  \showlemma{#1}%
  \Hy@raisedlink{\hypertarget{\csuse{thisedtext@the} edtext@level}:end}{}%}
\else%
  \showlemma{#1}%
\fi%
\endverbatim

Finally, we add any insertions that are associated with the end of the lemma. Footnotes that are identified by symbols rather than by where the lemma begins in the main text need to be done here, and not above.

\begin{verbatim}
\ifx\end@lemmas\empty \else%
  \global\end@lemmas\to\x@lemma%
  \x@lemma%
  \global\let\x@lemma=\relax%
\fi%
\if@RTL%
  \flag@end@RTL%
\else%
  \flag@end%
\fi%
\endverbatim

We switch some flags to false.

\begin{itemize}
  \item The one that checks having footnotes inside a \texttt{edtext}.
\end{itemize}
The one that says we are inside a \texttt{edtext}. In fact, it is not a flag, but a counter which is increased to 1 in each level of \texttt{edtext}.

The one that says we are inside a \texttt{lemma}.

We also reset \texttt{@beforeinsertofthisedtext}

If we are outside of a numbered paragraph, we send an error message and print the first argument.

A macro which just checks the arguments of the \texttt{edtext} and let know if there is some problem, like, for example, \texttt{pstart} inside.

\texttt{@beforeinsertofthisedtext} is an internal macro. \texttt{reledmac} or \texttt{reledpar} can add in this macro any content required to be executed before doing any \texttt{insert} related to a \texttt{edtext}. Its content is \texttt{let} equal to \texttt{relax} at the end of every \texttt{edtext}.

The \texttt{ifnumberline} option can be set to FALSE to disable line numbering.
The \texttt{set@line} macro is called by \texttt{edtext} to put the line-reference field and font specifier for the current block of text into \texttt{l@d@nums}.

One instance of \texttt{edtext} may generate several notes, or it may generate none — it is legitimate for argument \#2 to \texttt{edtext} to be empty. But \texttt{flag@start} and \texttt{flag@end} induce the generation of a single entry in \texttt{line@list} during the next run, and it is vital to also remove one and only one \texttt{line@list} entry here.

If no more lines are listed in \texttt{line@list}, something is wrong — probably just some change in the input. We set all the numbers to zeros, following an old publishing convention for numerical references that have not yet been resolved.
VI.2 Substitute lemma

The macro \edfont@info returns coded information about the current font.

\newcommand*{\edfont@info}{\f@encoding/\f@family/\f@series/\f@shape}

\lemma The \lemma{⟨text⟩} macro allows you to change the lemma that is passed on to the notes. Read about \@tag in normal \edtext macro for more details about \sw@list@inedtext and \no@expands (VI.1 p. 141).

\newcommand*{\lemma}[1]{\global\@lemmacommand@true\global\renewcommand{\@tag}{\no@expands #1}\ignorespaces}

\@lemma The \@lemma is written in the numbered file to set which \edtext has an \lemma as second argument.

\newcommand{\@lemma}{\booltrue{lemmacommand@the}\edtext@level}\

\if@lemmacommand@ This boolean is set to TRUE inside a \edtext (or \critext) when a \lemma command is called. That is useful for some commands which can have a different behavior if the lemma in the note is different from the lemma in the main text.

\newif{\if@lemmacommand@}

\linenum The \linenum macro can change any or all of the page and line numbers that are passed on to the notes.

As argument \linenum takes a set of seven parameters separated by vertical bars, in the format used internally for \l@d@nums (see V.9 p. 109): the starting page, line, and sub-line numbers, followed by the ending page, line, and sub-line numbers, and then the font specifier for the lemma. However, you can omit any parameters you do not want to change, and you can omit a string of vertical bars at the end of the argument. Hence
\linenum{18|4|0|18|7|1|0} is an invocation that changes all the parameters, but \linenum{13} only changes the starting line number, and leaves the rest unaltered.

We use `\` as an internal separator for the macro parameters.

\linenum calls \line@set to do the actual work; it looks at the first number in the argument to \linenum, sets the corresponding value in \l@d@nums, and then calls itself to process the next number in the \linenum argument, if there are more numbers in \l@d@nums to process.

\line@set uses \l@d@add to tack numbers or vertical bars onto the right hand end of \l@d@nums.

\l@d@add \line@set uses \l@d@add to tack numbers or vertical bars onto the right hand end of \l@d@nums.

\lineannot last but not least, \lineannot allows us to substitute line number annotation. It is different from \linenum for backward compatibility with older versions of \reledmac. It calls \lineannot@set to determine whether we must change only one annotation or two, or none.
VI.4 Lemma disambiguation

The mechanism which counts the occurrence of a same word in a same line is quite complex, because, when \TeX reads a command between a \texttt{\pstart} and a \texttt{\pend}, it does not know yet which are the line numbers.

The general mechanism is the following:

- **At the first run**, each \texttt{\sameword} command increments an \texttt{etoolbox} counter the name of which contains the argument of the \texttt{\sameword} commands.

- Then this counter associated with the argument of \texttt{\sameword} is stored with the \texttt{@sw} command in the auxiliary file of the current \texttt{reledmac} section (the .1, .2… file).

- **When this auxiliary file is read at the second run**, different operations are achieved:

1. Get the rank of each \texttt{\sameword} in a line (relative rank) from the rank of each \texttt{\sameword} in all the numbered section (absolute rank):
   - For each paired \texttt{\sameword} argument and absolute line number, a counter is defined. Its value corresponds to the number of times \texttt{\sameword{⟨argument⟩}} is called from the beginning of the lineation to the end of the current line. We also store the same data for the preceding absolute line number, if it does not have \texttt{\sameword{⟨argument⟩}}.
   - For each \texttt{\sameword} having the same argument, we subtract from its absolute rank the number stored for the paired \texttt{\sameword} argument and previous absolute line number. Consequently, we obtain the relative rank.
   - See the following example which explains how, for same \texttt{\sameword}, absolute ranks are transformed to relative ranks.

   At line 1:
   absolute rank 1 becomes relative rank 1-0 = 1
   1 is stored for this \texttt{\sameword} and line 1

   At line 2:
   absolute rank 2 becomes relative rank 2-1 = 1
   absolute rank 3 becomes relative rank 3-1 = 2
   3 is stored for this \texttt{\sameword} and line 2

   At line 3:
   no \texttt{\sameword} for this line.
   3 is stored for this \texttt{\sameword} and line 3

   At line 4:
   absolute rank 4 becomes relative rank 4-3 = 1
4 is stored for this \sameword and line 4

2. Create lists of lists of \sameword by depth of \edtext. That is: create a list for \edtexts of level 1, a list for \edtexts of level 2, a list for \edtexts of level 3 etc. For each \edtext in these lists, we store all of the relative ranks of \sameword which are called as lemma information. That is: 1) either called in the first argument of \sameword, or, 2) called in the \lemma macro of the second argument of \sameword AND marked by the optional argument of \sameword in first argument of \edtext.

For example, suppose a line with nested \edtexts which contains some word marked by \sameword and having the following relative rank:

\begin{verbatim}
bar \hspace{1cm} foo^1 foo^2 bar^2 foo^3 (A)(B) foo^4 bar^3 \hspace{1cm} (C) \hspace{1cm} foo^5 (D) bar^4 \hspace{1cm} (E)
\end{verbatim}

In this example, all lemma information for \edtext is framed. The text in parenthesis is the content of critical notes associated to the preceding frame. As you can see, we have two levels of \edtext.

The list for \edtexts of level 1 is \{\{1, 2, 2, 3, 4, 3\}, \{5, 4\}\}.
The list for \edtexts of level 2 is \{\{1, 2, 2, 3\}, \{5\}\}.

As you can see, the mandatory argument of \sameword does not matter: we store the rank informations for every word potentially ambiguous.

- At the second run, when a critical notes is called, we associate it to the next item of the list associated to its \edtext level. So, in the previous example:
  - Critical notes (A) and (B) are associated with \{1, 2, 2, 3\}.
  - Critical note (C) is associated with \{1, 2, 2, 3, 4, 3\}.
  - Critical note (D) is associated with \{5\}.
  - Critical note (E) is associated with \{5, 4\}.

- At the second run, when a critical note is printed:
  - The \sameword command is let \sameword@inedtext.
  - At each call of this \sameword@inedtext, we step to the next element of the list associated to the note. Let it be \(r\).
  - For the word marked by \sameword, we calculate how many time it is called in its line. To do it:
    - We get the absolute line number of the current \sameword. This absolute line number was stored with a list of relative ranks for the current \edtext. That means, in the previous example, that if the absolute line number of \edtext was 1, that critical notes (A) and (B) were not associated with \{1, 2, 2, 3\} but with \{(1, 1), (2, 1), (2, 1), (3, 1)\}. Such a method of knowing the absolute line number associated to a \sameword is required because a \edtext can overlap many lines, but \sameword can’t get it.
VI.4 Lemma disambiguation

When reading the auxiliary file, we get the value associated to the pair composed by the current marked word and the current absolute line number. To this value, we subtract the value associated to the pair composed by the current marked word and the previous absolute line number. Let the result be \( n \).

- If \( n > 1 \), that means the current word appears more than once in its line. In this case, we call \texttt{showwordrank} with the word as the first argument and \( r \) as the second argument. If the word is called only once, we just print it.

After theory, implementation. First, getting a sanitized form of the argument of \texttt{sameword}

```latex
\newcommand{\get@sw@txt}[1]{% 
  \begingroup
  \swnoexpands% 
  \% 
  \begin{lrbox}{\swbox@tmp}\
  \ifsw@caseinsensitive% 
  \def\@tmpa##1{\lowercase{##1}}%

  \let\textbf\@firstofone% 
  \let\textsc\@firstofone% 
  \let\framebox\@firstofone% 
  \let\edtext\dummy@edtext% 
  \RenewExpandableDocumentCommand{\edindex}{om}{}% 
  \ifdefined\index% 
  \RenewExpandableDocumentCommand{\index}{om}{}% 
  \fi% 
  \let\selectlanguage\@gobble% 
```
The high level macro `\sameword`, used by the editor.

Now, the real code. First, increment the counter corresponding to the argument.

Then, write its value to the numbered file.

Do the same thing if we are in the right column.

And print the word.

A flag set to true if a `\@sw` relative rank must be added to the list of ranks for a specific `\edtext`. 
VI.4 Lemma disambiguation

The command printed in the auxiliary files.

First, define a counter which store the second argument as value for a each paired absolute line number/first argument

Then, calculate the position of the word in the line.

And do the same thing for the right side.

And now, add it to the list of \@sw for the current edtext, in all depth.
The command called when \sameword is called in a \edtext.

\newcommandx{\sameword@inedtext}[2][1, usedefault]{
  \get@sw@txt{#2}

Finally, the way the rank will be printed.

```
\newcommand{\showwordrank}{#2}\%
#1\textsuperscript{#2}\%
%
\showwordrank
```

**VII  Paragraph decomposition and reassembly**

In order to be able to count the lines of text and affix line numbers, we add an extra stage of processing for each paragraph. We send the paragraph into a box register, rather than straight onto the vertical list, and when the paragraph ends we slice the paragraph into
its component lines; to each line we add any notes or line numbers, add a command
to write to the line-list, and then at last send the line to the vertical list. This section
contains all the code for this processing.

VII.1 Boxes, counters, \pstart and \pend

Here are numbers and flags that are used internally in the course of the paragraph de-
composition.

When we first form the paragraph, it goes into a box register, \raw@text, instead
of onto the current vertical list. The \ifnumberedpar@ flag will be true while a para-
graph is being processed in that way. \num@lines will store the number of lines in the
paragraph when it is complete. When we chop it up into lines, each line in turn goes
into the \one@line register, and \par@line will be the number of that line within the
paragraph.

\newbox \raw@text \newif \ifnumberedpar@ \newcount \num@lines \newbox \one@line \newcount \par@line

\pstarts@typeset@L \pstarts@read@L

\pstart \AtEveryPstart \AtStartEveryPstart \numberpstarttrue \numberpstartfalse \labelpstarttrue \labelpstartfalse \thestart\ifat@every@pstart\star\@%

\pstart starts the paragraph by clearing the \inserts@list list and other relevant
variables, and then arranges for the subsequent text to go into the \raw@text box.
\pstart needs to appear at the start of every paragraph that is to be numbered; the
\autopar command below may be used to insert these commands automatically.

Beware: everything that occurs between \pstart and \pend is happening within
a group; definitions must be global if you want them to survive past the end of the
paragraph.

\newcommand{\AtStartEveryPstart}[1]{% \ifstrempty{#1}% \{\gdef{\at@start@every@pstart@}}%

\end{verbatim}
We set all the usual interline penalties to zero and then immediately call `\endgraf` to end the paragraph; this ensures that there will be no large interline penalties to prevent us from slicing the paragraph into pieces. These penalties revert to the values that you set when the group for the `\vbox` ends. Then we call `\do@line` to slice a line off the top of the paragraph, add a line number and footnotes, and restore it to the page; we keep doing this until there are not any more lines left.

{\xdef\@at@end@every@pend{}}%
VII.1 Boxes, counters, \pstart and \pend

\l@dzeropenalties A macro to zero penalties for \pend or \pstart.

\autopar In most cases it is only an annoyance to have to label the paragraphs to be numbered with \pstart and \pend. \autopar will do that automatically, allowing you to start a paragraph with its first word and no other preliminaries, and to end it with a blank line or a \par command. The command should be issued within a group, after \beginnumbering has been used to start the numbering; all paragraphs within the group will be affected.

A few situations can cause problems. One is a paragraph that begins with a begin-group character or command: \pstart will not get invoked until after such a group beginning is processed; as a result the character that ends the group will be mistaken for the end of the \vbox that \pstart creates, and the rest of the paragraph will not be numbered. Such paragraphs need to be started explicitly using \indent, \noindent, or \leavevmode — or \pstart, since you can still include your own \pstart and \pend commands even with \autopar on.

Prematurely ending the group within which \autopar is in effect will cause a similar problem. You must either leave a blank line or use \par to end the last paragraph before you end the group.

The functioning of this macro is more tricky than the usual \everypar: we do not want anything to go onto the vertical list at all, so we have to end the paragraph, erase any evidence that it ever existed, and start it again using \pstart. We remove the paragraph-indentation box using \lastbox and save the width, and then skip backwards over the \parskip that has been added for this paragraph. Then we start again with \pstart, restoring the indentation that we saved, and locally change \par so that it will do our \pend for us.

The boolean \ifautopar is set to TRUE while \autopar is enabled, and the \ifbyautopar is set to TRUE at each \pstart automatically called by the \autopar feature. A manual \pstart will have a \ifbyautopar set to FALSE.
VII.2 Processing one line

VII.2.1 General process

The `\do@line` macro is called by `\pend` to do all the processing for a single line of text. The `\l@dunhbox@line` macro only `\unhbox`es one line, but packages like `\microtype` can override it as required.
VII.2 Processing one line

Depending weither a sectioning command is called at this pstart or not we print sectioning command or normal line,

\ifinlist{\the\pstarts@typeset@L}{\eled@sections@@}{}
\print@eledsection
\print@line
\IfStrEq{\led@pb@setting}{after}{\led@check@pb\led@check@nopb}{}

VII.2.2 Process for “normal” line

\print@line \print@line is for normal line, i.e line without sectioning command.

\def\print@line{
%  Insert the pstart number inside, if we are in the first line of a pstart.
  \affixpstart@num
%  The line will be boxed, to have the good width.

  \@tempdima=\@morespace@leftnote@rightcolumn%
}%
  \@tempdima=\z@%
}%
\hb@xt@\z@{\hss\box\l@dlp@rbox\kern\ledlsnotesep\hskip\@tempdima}%
%
\newcommand{\l@drsn@te}{%
\ifboolexpr{bool {l@dprintingcolumns} and not bool {ledRcol0}}{% If we are on a left column
  \@tempdima=\@morespace@rightnote@leftcolumn%
}%
  \@tempdima=\z@%
}%
\hb@xt@\z@{\hskip\@tempdima\kern\ledrsnotesep\box\l@drlp@rbox\hss}%
%
%
\sloppy

These macros are called at the left (\texttt{\textbackslash ledllfill}) and the right (\texttt{\textbackslash ledrlfill}) of each numbered line. The initial definitions correspond to the original code for \texttt{\textbackslash do@line}.

\begin{verbatim}
\newcommand*{\ledllfill}{\hfil}
\newcommand*{\ledrlfill}{\null}
\end{verbatim}

\section{Line and page number computation}

The \texttt{\textbackslash getline@num} macro determines the page and line numbers for the line we are about to send to the vertical list.

\begin{verbatim}
\newcommand*{\getline@num}{\global\advance\absline@num \@ne \do@actions \do@ballast \ifnumberline \ifs sublines@ \ifnum\sub@lock<\tw@ \global\advance\subline@num \@ne \fi \else \ifnum\@lock<\tw@ \global\advance\line@num \@ne \global\subline@num \z@ \fi \fi \fi}
\end{verbatim}

The real work in the macro above is done in \texttt{\textbackslash do@actions}, but before we plunge into that, let's get \texttt{\textbackslash do@ballast} out of the way. This macro looks to see if there is an action to be performed on the next line, and if it is going to be a page break action, \texttt{\textbackslash do@ballast} decreases the count \texttt{\ballast@count} counter by the amount of \texttt{ballast}. This means, in practice, that when \texttt{\add@penalties} assigns penalties at this point, \TeX{} will be given extra encouragement to break the page here (see \texttt{XII.2 p. 180}).

\begin{verbatim}
\newcount\ballast@count
\newcounter{ballast}
\setcounter{ballast}{0}
\end{verbatim}

First we set up the required counters; they are initially set to zero, and will remain so unless you type \texttt{\setcounter{ballast}{⟨some figure⟩}} in your document.

And here is \texttt{\textbackslash do@ballast} itself. It advances \texttt{\absline@num} within the protection of a group to make its check for what happens on the next line.
The \do@actions macro looks at the list of actions to take at particular absolute line numbers, and does everything that is specified for the current line.

It may call itself recursively, and to do this efficiently (using \TeX’s optimization for tail recursion), we define a control-sequence called \do@actions@next that is always the last thing that \do@actions does. If there could be more actions to process for this line, \do@actions@next is set equal to \do@actions; otherwise it is just \relax.

First, page number changes, which will generally be the most common actions. If we are restarting lineation on each page, this is where it happens.

\begin{verbatim}
\newcommand*{\do@actions}{
  \global\let\do@actions@next=\relax
  \ifnum\absline@num<\next@actionline
    \fi
    \fi\%
  \ifboolexpr{\booltrue{resumenumbering@start} \and test {\ifdimgreater{\pagedepth}{\z@}}}{\global@firstlineofpagetrue}{%
    \global\reset@line\the\absline@num \@\the\section@num%
    \ifcsdef{reset@line\the\absline@num \@\the\section@num}{%
      \global\line@num=\z@%
      \global\subline@num=\z@%
      \resetprevline@%
    }{%}
  }
  \ifnum\next@actionline=-1001
    \global\page@num=\next@action
    \ifresumenumbering@start%
      \setbox0=\hbox{}
      \ifnum\pausenumbering@page@num<\page@num%
        \global\resumenumbering@startfalse%
      \fi%
    \fi%
    \ifboolexpr{\booltrue{resumenumbering@start} \and test {\ifdimgreater{\pagedepth}{\z@}}}{\global@firstlineofpagetrue}{%
      \global\reset@line\the\absline@num \@\the\section@num%
      \ifcsdef{reset@line\the\absline@num \@\the\section@num}{%
        \global\line@num=\z@%
        \global\subline@num=\z@%
        \resetprevline@%
      }{%}
    }
  \fi
}
\end{verbatim}
Next, we handle commands that change the line-number values. (We subtract 5001 rather than 5000 here because the line number is going to be incremented automatically in \getline@num.)

\else
  \ifnum\next@action<-4999
    \@l@dtempcnta=-\next@action
    \advance\@l@dtempcnta by -5001
    \ifsuslines@
      \global\subline@num=\@l@dtempcnta
    \else
      \global\line@num=\@l@dtempcnta
    \fi
  \fi
\fi

We rescale the value in \@l@dtempcnta so that we can use a case statement.

\else
  \@l@dtempcnta=-\next@action
  \advance\@l@dtempcnta by -1000
  \do@actions@fixedcode
  \fi
\fi

Now we get information about the next action off the list, and then set \do@actions@next so that we will call ourselves recursively: the next action might also be for this line.

There is no warning if we find \actionlines@list empty, since that will always happen near the end of the section.

\ifx\actionlines@list\empty
  \gdef\next@actionline{1000000}
\else
  \g@p\actionlines@list to \next@actionline
  \g@p\actions@list to \next@action
  \global\let\do@actions@next=\do@actions
  \fi
\fi

Make the recursive call, if necessary.

\do@actions@next

This macro handles the fixed codes for \do@actions. It is one big case statement.

\newcommand*{\do@actions@fixedcode}{% 
  \ifcase\@l@dtempcnta
    \or% 1001 = starting sublineation
    \global\sublines@true
  \else
    \global\sublines@false
  \fi
}
The `continuousnumberingwithcolumns` option allows to alternate between single text and two parallel texts, keeping the same line numbers when switching from one layout to the other. The lines counter for the text in a single column and for the text in the left column in parallel typesetting is the same. But the lines counter for the text in the same column is the not the same.

When typesetting single column text, if the option is enabled, we need to "simulate" typesetting right line, in order to keep the two counters synchronized. That is the aim of the `\continuousnumberingwithcolumns@sync@linenumber@singletext` macro.

```latex
\newcommand{\continuousnumberingwithcolumns@sync@linenumber@singletext}{%
\or% \% 1002 = ending sublineation
\global\sublines@false
\or% \% 1003 = starting locking number
\global\@lock=\@ne
\or% \% 1004 = ending locking number
\ifnum\@lock=\@tw@
  \global\@lock=\@thr@@
\else
  \global\@lock=\@z@
\fi
\or% \% 1005 = starting locking subnumber
\global\sub@lock=\@ne
\or% \% 1006 = ending locking subnumber
\ifnum\sub@lock=\@tw@
  \global\sub@lock=\@thr@@
\else
  \global\sub@lock=\@z@
\fi
\or% \% 1007 = skipping numbering
\@dskipnumbertrue
\or% \% 1008 = skipping numbering in stanza
\@dskipverse@numbertrue%
\or% \% 1009 = hiding number

\or% \% 1010 = inserting msdata
\add@msdata%
\else
  \@ed@warn@BadAction
\fi}
```
The \texttt{\linenumannotation} allows users to add manual annotations to line numbers, for example to refer to line numbers from an older edition.

That implies that annotations be added

- in marginal line numbers. This feature is implemented by associating annotations with the absolute line numbers when reading the auxiliary numbered files (.1, .2 etc.).

- in critical footnotes. This feature is implemented by associating start / end line number annotations with each \texttt{\edtext} when reading the auxiliary numbered files.

- to crossref commands which refer to line numbers (to be completed when I will have resolved this issue).

\texttt{\linenumannotation} First, the user-level command, which only writes commands to the numbered files, storing the annotation.

\texttt{\Xlinenumannotationposition@side} The \texttt{\Xlinenumannotationposition@side} macro, to determine the position of line number annotations in lines printed in the side, relative to the line number position. The default value is “after”, but it can be changed to “before”, using the \texttt{\Xlinenumannotationposition@side} macro.
The `\wraplinenumannotation@ref` macro is applied to line annotations in crossref.
The `\wraplinenumannotation@side` macro is applied to line annotation in sides.
They must be modified by users using `\wraplinenumannotation`. By default, they call `\textsuperscript`.

We also define `\xoidenticallinenumannotation@ref` and `\xoidenticallinenumannotation@side`.

\begin{verbatim}
\newtoggle{Xnoidenticallinenumannotation@ref}
\newtoggle{Xnoidenticallinenumannotation@side}
\end{verbatim}

\begin{verbatim}
\newcommand{\@annot}{% 
  \store@annot@to@absline{#1}% 
  \def\current@annot{#1}%

\begin{verbatim}
\let\current@annot=\empty%
\end{verbatim}

Then, the numbered files command `\@annot`, which

\begin{itemize}
  \item associates the annotation to the absolute lines number.
  \item stores the current annotation in a macro to be used by the `\@ref@reg` macro, which manages all things related to `\edtext` in numbered files. As we don’t want to store it multiple times in the event of nested `\edtext`, we use an auxiliary macro, `\store@annot@to@absline`, which is set to `\@gobble` when we parse nested `\edtext` in numbered auxiliary files.
\end{itemize}

By default, there is no annotation to a line number, so we store an empty `\current@annot`.
\reset@current@annot is called at each \@nl in numbered auxiliary files. It resets the annotation of line numbers at each line.

\newcommand{\reset@current@annot}{\%
  \unless\ifnoresetlinenumannotation@\let\current@annot\empty\fi\%\%
}

\parse@annot In the \annot@list list, each individual \edtext is associated with a starting and an ending line number annotation, which is stored this way: start annotation|end annotation. The \parse@annot reads the format and defines two global macros.

\def\parse@annot#1|#2|{\
  \gdef\annot@start{#1}\
  \gdef\annot@end{#2}\
}

\setlinenumannotationsep The separator between the annotations and the way to redefine it.

\newcommand{\setlinenumannotationsep}[1]{\gdef\@linenumannotationsep{#1}}\%
\def\@linenumannotationsep{, }%

\affixline@num just puts a left line number into \l@dld@ta or a right line number into \l@d@rd@ta as required.

To determine whether we need to affix a line number to this line, we compute the following:

\[
n = \text{int}\left(\frac{\text{linenum} - \text{firstlinenum}}{\text{linenumincrement}}\right)\]
\[
m = \text{firstlinenum} + (n \times \text{linenumincrement})\]

(where int truncates a real number to an integer). \(m\) will be equal to \text{linenum} only if we are to paste a number on here. However, the formula breaks down for the first line to number (and any before that), so we check that case separately: if \line@num \leq \firstlinenum, we compare the two directly instead of making these calculations.

We compute, in the scratch counter \@l@dt@mp@cn@ta, the number of the next line that should be printed with a number (\(m\) in the above discussion), and move the current line number into the counter \@l@dt@mp@cn@t@b for comparison.

First, the case when we are within a sub-line range.
No number is attached if \texttt{\if@groupnotes} is TRUE (and then it is set to its normal FALSE value). No number is attached if \texttt{\ifnumberline} is FALSE (the normal value is TRUE).

\begin{verbatim}
\if@groupnotes\else
  \ifnumberline
    \if@skipnumber
      \global\@skipnumberfalse
    \else
      \if@linebreak
        \@tempcntb=\linebreaknum
        \ifnum\linebreaknum>\c@firstlinenum
          \@tempcnta=\linebreaknum
          \advance\@tempcnta by-\c@firstlinenum
          \divide\@tempcnta by\c@lineincrement
          \multiply\@tempcnta by\c@lineincrement
          \advance\@tempcnta by\c@firstlinenum
        \else
          \@tempcnta=\c@firstlinenum
        \fi
      \fi
      \else
        \@tempcntb=\linebreaknum
      \fi
    \fi
  \fi
\end{verbatim}

That takes care of computing the values for comparison, but if line number locking is in effect we have to make a further check. If this check fails, then we disable the line-number display by setting the counters to arbitrary but unequal values.

\begin{verbatim}
\checksublock
\end{verbatim}

Now the line number case, which works the same way.

\begin{verbatim}
\else
  \@tempcntb=\linebreaknum
\end{verbatim}

Check on the \texttt{\linenumberlist} If it is \texttt{\empty} use the standard algorithm.

\begin{verbatim}
\ifx\linenumberlist\empty
  \ifnum\linebreaknum>\c@firstlinenum
    \@tempcntb=\linebreaknum
    \advance\@tempcntb by-\c@firstlinenum
    \divide\@tempcntb by\c@lineincrement
    \multiply\@tempcntb by\c@lineincrement
    \advance\@tempcntb by\c@firstlinenum
  \else
    \@tempcntb=\c@firstlinenum
  \fi
\fi
\end{verbatim}

The \texttt{\linenumberlist} was not \texttt{\empty}, so here is Wayne's numbering mechanism. This takes place in \TeX{}'s mouth.
A locking check for lines, just like the version for sub-line numbers above.

%\ch@ck@l@ck
\fi
%

The following tests are true if we need to print a line number.

%\ifnum\@l@dtempcnta=\@l@dtempcntb
%\if\l@dskipversenumber
%\else
%If we got here, we are going to print a line number; so now we need to calculate a
number that will tell us which side of the page will get the line number. We start from
\line@margin, which asks for one side always if it is less than 2; and then if the side
does depend on the page number, we simply add the page number to this side code—
because the values of \line@margin have been devised so that this produces a number
that is even for left-margin numbers and odd for right-margin numbers.

For \LaTeX we have to consider two column documents as well. In this case Peter
Wilson thought we need to put the numbers at the outside of the column — the left of
the first column and the right of the second. Do the twocolumn stuff before going on
with the original code.

\l@dld@ta
\l@drd@ta
A left line number is stored in \l@dld@ta and a right one in \l@drd@ta.
Now fix the lock counters, if necessary. A value of 1 is advanced to 2; 3 advances to 0; other values are unchanged.

These macros handle line number locking for \affixline@num. \checksublock checks subline locking. If it fails, then we disable the line-number display by setting the counters to arbitrary but unequal values.
Similarly for line numbers.

\newcommand*{\ch@ck@l@ck}{%

\XI Pstart number printing inside

Inside, the printing of the pstart number runs like the printing of the line number. There are only a few differences:
The pstart counter is upgraded in the \pend command. Consequently, the \affixpstart@num command has not to upgrade it, unlike the \affixline@num which upgrades the lines counter.

To print the pstart number only at the beginning of a pstart, and not in every line, a boolean test is made. The \pstartnum boolean is set to TRUE at every \pend. It is tried in the \leftpstartnum and \rightpstartnum commands. After the try, it is set to FALSE.
XII  Restoring footnotes and penalties

Because of the paragraph decomposition process in order to number line, \texttt{reledmac} must hack the standard way \TeX{} works in order to manage insertion of footnotes, both critical and familiar.

We need to call the \texttt{\insert} commands not when the content of \texttt{\pstart...\pend} is read by \TeX{} by when each individual line is typeset.

Consequently, when reading the content of \texttt{\pstart...\pend}, we store the insertion (footnotes) in an specific \texttt{reledmac}'s list, and we restore them to the vertical list when printing each individual line.

XII.1  Add insertions to the vertical list

\texttt{\inserts@list}\linebreak[2]
\texttt{\inserts@list} is the list macro that contains the inserts that we save up for one paragraph.

\begin{verbatim}
\list@create{\inserts@list}
\end{verbatim}

\texttt{\add@inserts}\linebreak[2]
\texttt{\add@inserts} is the penultimate macro used by \texttt{\do@line}; it takes insertions saved in a list macro and sends them onto the vertical list.

It may call itself recursively, and to do this efficiently (using \TeX{}'s optimization for tail recursion), we define a control-sequence called \texttt{\add@inserts@next} that is always the last thing that \texttt{\add@inserts} does. If there could be more inserts to process for this line, \texttt{\add@inserts@next} is set equal to \texttt{\add@inserts}; otherwise it is just \texttt{\relax}.

\begin{verbatim}
\newcommand*{\add@inserts}{\%}
\global\let\add@inserts@next=\relax\% \%
\end{verbatim}

If \texttt{\inserts@list} is empty, there are not any more notes or insertions for this paragraph, and we need not waste our time.

\begin{verbatim}
\ifx\inserts@list\empty \else \%
\end{verbatim}

The \texttt{\next@insert} macro records the number of the line that receives the next footnote or other insert; it is empty when we start out, and just after we have affixed a note or insert.

\begin{verbatim}
\ifx\next@insert\empty\ifs{}\insertlines@list\empty\%
\global\noteschanged@true\%\gdef\next@insert{100000}\%
\else\%
\g@lp\insertlines@list\to\next@insert\fi
\fi
\end{verbatim}
XII.1 Add insertions to the vertical list

If the next insert’s for this line, tack it on (and then erase the contents of the insert macro, as it could be quite large). In that case, we also set \addinsertsnext so that we will call ourselves recursively: there might be another insert for this same line.

\fi
\% Make the recursive call, if necessary.
\addinsertsnext
\% If you use \Xgroupbyline, the insertion of the critical footnotes are not made immediately in \addinserts, but the content to be inserted is stored, in order to be inserted later in one block. This insertion in one block is made by \addXgroupbyline.
\newcommand{\addXgroupbyline}{%}
\unless\ifnocritical\%

    \else%
      \Xatbegininsertion{#1}%
      \ifcsstring{series@display#1}{normal}{%
        \Xledsetnormalparstuff{#1}%
      \}}}%
  \unvbox\@nameuse{mp#1footins}%
  \fi%
%}
XII.2 Penalties

\addpenalties is the last macro used by \do@line. It adds up the club, widow, and interline penalties, and puts a single penalty of the appropriate size back into the paragraph; these penalties get removed by the \vsplit operation. \displaywidowpenalty and \brokenpenalty are not restored, since we have no easy way to find out where we should insert them.

In this code, \num@lines is the number of lines in the whole paragraph, and \par@line is the line we are working on at the moment. The count \@dtempcnta is used to calculate and accumulate the penalty; it is initially set to the value of \ballast@count, which has been worked out in \do@ballast above (VIII p. 166). Finally, the penalty is checked to see that it does not go below −10000.
XII.3 Printing leftover notes

`\flush@notes` The `\flush@notes` macro is called after the entire paragraph has been sliced up and sent on to the vertical list. If the number of notes to this paragraph has increased since the previous run of \TeX, then there can be leftover notes that have not yet been printed. An appropriate error message will be printed elsewhere; but it is best to go ahead and print these notes somewhere, even if it is not in quite the right place. What we do is dump them all out here, so that they should be printed on the same page as the last line of the paragraph. We can hope that is not too far from the proper location, to which they will move on the next run. For the first run, we do not flush the notes, as that means all the notes will be added at the end of numbered section, and so, very far of the expected position.

```latex
\newcommand*{\flush@notes}{%
  \iftoggle{notfirstrun@\jobname.\extensionchars\the\section@num}{%
    \@xloop
    \texttt{\ifx\inserts@list\empty \else%}
    \texttt{\gl@p\inserts@list\to\@insert}%
    \texttt{\@insert}%
    \texttt{\global\let\@insert=\undefined%}
    \texttt{\repeat%}
  }{}%
%
%}
```

`\@xloop` is a variant of the Plain \TeX `\loop` macro, useful when it’s hard to construct a positive test using the \TeX `\if` commands—as in `\flush@notes` above. One types `\@xloop ... \if ... \else ... \repeat`, and the action following `\else` is repeated as long as the `\if` test fails. (This macro will work wherever the Plain \TeX `\loop` is used, too, so we could just call it `\loop`; but it seems preferable not to change the definitions of any of the standard macros.)

This variant of `\loop` was introduced by Alois Kabelschacht in *TUGboat* 8 (1987), pp. 184–5.
XII Restoring footnotes and penalties

XII.4 Text before notes

\set@Xtxtbeforenotes The \set@Xtxtbeforenotes macro resets the Xtxtbeforesnotes@⟨series⟩@typeset boolean to false. Just before the first note of the ⟨series⟩ in a page, the \Xtextbeforenotes will be inserted.

\set@txtbeforenotesX The \set@txtbeforenotesX does the same for the \textbeforenotesX.

\insert@Xtxtbeforenotes \insert@txtbeforenotesX \insert@Xtxtbeforenotes⟨⟨series⟩⟩, called when inserting a familiar footnote, will insert the text before the note if it is not already inserted. For paragraphed footnotes, it will insert it as a component of the first footnote. For other types of footnotes, it will insert it as a regular footnote.

\insert@txtbeforenotesX is the same for familiar footnotes.
XIII Critical footnotes

The footnote macros are adapted from those in Plain \TeX, but they differ in these respects: the outer-level commands must add other commands to a list macro rather than doing insertions immediately; there are many separate levels of the footnotes, not just one; and there are options to reformat footnotes into paragraphs or into multiple columns.
XIII.1 Fonts

Before getting into the details of formatting the notes, we set up some font macros. It is the notes that present the greatest challenge for our font-handling mechanism, because we need to be able to take fragments of our main text and print them in different forms: it is common to reduce the size, for example, without otherwise changing the fonts used.

\select@lemmafont\select@@lemmafont\select@lemmafont

\select@lemmafont is provided to set the right font for the lemma in a note. This macro extracts the font specifier from the line and page number cluster, and issues the associated font-changing command, so that the lemma is printed in its original font.

\select@lemmafont#1|#2|#3|#4|#5|#6|#7|\select@@lemmafont#7|
\def\select@lemmafont#1/#2/#3/#4|%\fontencoding{#1}\fontfamily{#2}\fontseries{#3}\fontshape{#4}%\selectfont\select@lemmafont

XIII.2 Individual note options

\footnoteoptions@\footnoteoptions@ The \footnoteoptions@[⟨side⟩]{⟨options⟩}{⟨value⟩} changes the value of on options of Xfootnote, to switch between true and false.

\newcommand*{\footnoteoptions@}[3]{%\def\do##1{%\ifstrequal{#1}{L}{% On the left side\xsright@appenditem{\noexpand\setkeys[mac]{#3footnoteoption}{\unexpanded{##1}}}{\inserts@list}\global\advance\insert@count \@ne% Increment the left insert counter.}{}%\xsright@appenditem{\noexpand\setkeys[mac]{#3footnoteoption}{\unexpanded{##1}}}{\inserts@listR}\global\advance\insert@countR \@ne% Increment the right insert counter.}{}%\notblank{#2}{\docsvlist{#2}}{}% Parsing all options}}

XIII.3 Notes language

\footnotelang@lua\footnotelang@lua is called to remember the information about the direction of a lemma when LuaLaTeX is used.

\newcommandx*{\footnotelang@lua}[1][1=L,usedefault]{%\ifstrequal{#1}{L}{%
XIII.3 Notes language

\footnotelang@poly

\footnotelang@poly is called to remember the information about the language of a lemma when polyglossia is used.
XIII.4 General survey of the way we manage notes

The processing of each note is done by four principal macros: the \vfootnote macro takes the text of the footnote and does the \insert; it calls on the \footfmt macro to select the right fonts, print the line number and lemma, and do any other formatting needed for that individual note. Within the output routine, the two other macros, \footstart and \footgroup, are called; the first prints extra vertical space and a footnote rule, if desired; the second does any reformatting of the whole set of the footnotes in this series for this page—such as paragraphing or division into columns—and then sends them to the page.

These four macros, and the other macros and parameters shown here, are distinguished by the 'series letter' that indicates which set of the footnotes we are dealing with—A, B, C, D, or E. The series letter always precedes the string foot in macro and parameter names. Hence, for the A series, the four macros are called \vAfootnote, \Afootfmt, \Afootstart, and \Afootgroup.

These macros are changed depending of the footnotes arrangement: "normal", "paragraphed", "two columns" or "three columns".

XIII.5 General setup

\footsplitwrite{Some setup code that is common for a variety of the footnotes. The setup is for:

- \interlinepenalty.
- \splittopskip (skip before last part of notes that flow from one page to another).
- \splitmaxdepth.
- \floatingpenalty, that is penalty values being added when a long note flows from one page to another. Here, we let it to 0 when we are processing parallel pages in \eledpar, in order to allow notes to flow from left to right pages and vice-versa. Otherwise, we let it to @\@MM, which is the standard \LaTeX floatingpenalty.

\newcommand*{\footsplitwrite}{%\linenomath
\interlinepenalty=\interfootnotelinepenalty
\unless\if@defining\floatingpenalty=\@MM%
\fi%
\splittopskip=\ht\strutbox \splitmaxdepth=\dp\strutbox
\leftskip=\z@skip \rightskip=\z@skip}
XIII.6  Footnotes arrangement

XIII.6.1  User level macro

\Xarrangement\[\langle s \rangle\]{\langle arrangement \rangle} The command calls, for each series, a specific command which set many counters and commands in order to define specific arrangement.

\newcommandx{\Xarrangement}[2][1,usedefault]{%  
\def\do##1{%  
\csname Xarrangement@#2\endcsname{##1}%  
}\ifstrempty{#1}%  
{%  
\dolistloop{\@series}%  
}%  
\docsvlist{#1}%  
}%  
}%

XIII.6.2  Normal footnote

\Xarrangement@normal We can now define all the parameters for the series of footnotes; initially they use the “normal” footnote formatting.

What we want to do here is to insert something like the following for each footnote series. (This is an example, not part of the actual \reledmac code.)

\skip\Afootins=12pt plus5pt minus5pt  
\count\Afootins=1000  
\dimen\Afootins=0.8\vsize  
\let\vAfootnote=\normalvfootnote \let\Afootfmt=\normalfootfmt  
\let\Afootstart=\normalfootstart \let\Afootgroup=\normalfootgroup  
\let\Afootnoterule=\normalfootnoterule

(Read The \TeXbook in order to understand what are the counter, skip and dimen associated to an insertion.)

Instead of repeating ourselves, we define a \Xarrangement@normal macro that makes all these assignments for us, for any given series letter. This command is called when people use \Xarrangement[\{series\}]{normal}

Now we set up the \Xarrangement@normal macro itself. It takes one argument: the footnote series letter.
The `reledpar` provides tools in order to confine notes to one side. The mechanism is explained in the `reledpar`'s handbook. For now, just retain we need to store default value of the counter associated to the notes \TeX's inserts.

\begin{verbatim}
\newcommand*{\Xarrangement@normal}[1]{%\csgdef{series@display#1}{normal}
\expandafter\let\csname #1footstart\endcsname=\normalfootstart
\expandafter\let\csname v#1footnote\endcsname=\normalvfootnote
\expandafter\let\csname #1footfmt\endcsname=\normalfootfmt
\expandafter\let\csname #1footgroup\endcsname=\normalfootgroup
\expandafter\let\csname #1footnoterule\endcsname=\normalfootnoterule
\count\csname #1footins\endcsname=1000
\dimen\csname #1footins\endcsname=\csuse{Xmaxhnotes@#1}
\skip\csname #1footins\endcsname=\csuse{Xbeforenotes@#1}%
\advance\skip\csname #1footins\endcsname by\csuse{Xafterrule@#1}%
}\count\csname #1footins\endcsname=1000
\dimen\csname #1footins\endcsname=\csuse{Xmaxhnotes@#1}
\skip\csname #1footins\endcsname=\csuse{Xbeforenotes@#1}%
\advance\skip\csname #1footins\endcsname by\csuse{Xafterrule@#1}%
\csxdef{default@#1footins}{1000} %Use this to confine the notes to one side only
\end{verbatim}

Now do the setup for minipage footnotes. We use as much as possible of the normal setup as we can (so the notes will have a similar layout).

\begin{verbatim}
\ifnoledgroup@\else%
\expandafter\let\csname mpv#1footnote\endcsname=\mpnormalvfootnote
\expandafter\let\csname mp#1footgroup\endcsname=\mpnormalfootgroup
\count\csname mp#1footins\endcsname=1000
\dimen\csname mp#1footins\endcsname=\csuse{Xmaxhnotes@#1}
\skip\csname mp#1footins\endcsname=\csuse{Xbeforenotes@#1}%
\advance\skip\csname mp#1footins\endcsname by\csuse{Xafterrule@#1}%
\fi%
\end{verbatim}

\texttt{\normalvfootnote} We now begin a series of commands that do ‘normal’ footnote formatting: a format much like that implemented in \TeX's \texttt{PLAIN \TeX}, in which each footnote is a separate paragraph.

\texttt{\normalvfootnote} takes the series letter as \#1 and the entire text of the footnote is \#2. It does the \texttt{\insert} for this note, calling on the \texttt{\footfmt} macro for this note series to format the text of the note.

\begin{verbatim}
\notbool{parapparatus@}{\newcommand*}{\newcommand}{\normalvfootnote}[2]{%
\iftoggle{Xgroupbyline@#1}{%In the case we use \texttt{\Xgroupbyline}, the insertion is done later, in \texttt{\add\Xgroupbyline}.
\prepare\Xgroupbyline[#1]{\#2}{\normalvfootnote@inserted}%
}{%In the case we don't use \texttt{\Xgroupbyline}, the insertion is made directly

And somewhat different versions of \normalvfootnote and \normalvfootnoteinserted
for minipages.
XIII Critical footnotes

\mpnormalvfootnote is a 'normal' macro to take the footnote line and page number information (see V.9 p. 109), and the desired text, and output what's to be printed. Argument #1 contains the line and page number information and lemma font specifier; #2 is the lemma; #3 is the note's text; #4 is the note's series. This version is very rudimentary—it uses \printlines to print just the range of line numbers, followed by a square bracket, the lemma, and the note text.

\mpnormalvfootnoteinserted is a standard footnote-starting macro, called in the output routine whenever there are footnotes of this series to be printed: it skips a bit and then draws a rule.

\normalfootfmt is a 'normal' macro to take the footnote line and page number information (see V.9 p. 109), and the desired text, and output what's to be printed. Argument #1 contains the line and page number information and lemma font specifier; #2 is the lemma; #3 is the note's text; #4 is the note's series. This version is very rudimentary—it uses \printlines to print just the range of line numbers, followed by a square bracket, the lemma, and the note text.
Any \footstart macro must put onto the page something that takes up space exactly equal to the \skip\Xfootins value for the associated series of notes. \TeX makes page computations based on that \skip value, and the output pages will suffer from spacing problems if what you add takes up a different amount of space.

But if the skip \Xprenotes@ is greater than 0 pt, it is used instead of \skip\footins for the first printed series in one page.

The \leftskip and \rightskip values are both zeroed here. Similarly, these skips are cancelled in the \vfootnote macros for the various types of notes. Strictly speaking, this is necessary only if you are using paragraphed footnotes, but we have put it here and in the other \vfootnote macros too so that the behavior of reledmac in this respect is general across all footnote types. What this means is that any \leftskip and \rightskip you specify applies to the main text, but not the footnotes. The footnotes continue to be of width \hsize.

\newcommand*{\normalfootstart}[1]{%
  \ifdimequal{0pt}{\Xprenotes@}{}%

}

The first series of notes printed in a page can have a specific skip before it. In order to insert this specific skip without overlap the bottom margin of the page, Maïeul Rouquette have defined an algorithm explained in XIX p. 245. Here is part of this algorithm, when the block of notes are ready to be printed.

\leftskip0pt \rightskip0pt
\ifl@dpairing\else  \\

XIII.6.3 Paragraphed footnotes

The paragraphed-footnote option reformats all the footnotes of one series for a page into a single paragraph; this is especially appropriate when the notes are numerous and brief. The code is based on The TeXbook, pp. 398–400, with alterations for our environment. This algorithm uses a considerable amount of save-stack space: a \TeX of ordinary size may not be able to handle more than about 100 notes of this kind on a page.

\Xarrangement@paragraph The \Xarrangement@paragraph macro sets up everything for one series of the footnotes so that they will be paragraphed; it takes the series letter as argument. We include
the setting of \count\footins to 1000 for the footnote series just in case user is switching to paragraphed footnotes after having columnar ones, since they change this value (see below).

The argument of \Xarrangement@footparagraph is the letter denoting the series of notes to be paragraphed.

\footfudgefiddle For paragraphed footnotes \TeX{} has to estimate the amount of space required. If it underestimates this then the notes may get too long and run off the bottom of the text block. \footfudgefiddle can be increased from its default 64 (say, to 70) to increase the estimate.

\para@footsetup \footparagraph calls the \para@footsetup macro to calculate a special fudge factor, which is the ratio of the \baselineskip to the \hsize. We assume that the proper value of \baselineskip for the footnotes (normally 9 pt) has been set already. The argument of the macro is again the note series letter.

Peter Wilson thinks that \columnwidth should be used here for \TeX{} not \hsize. Peter Wilson have also included \footfudgefiddle.
\setXnoteswidthliketwocolumns@{#1}\
\ifcempty{Xwidth@#1}{}\%
\columnwidth=\expandafter\dimexpr\csuse{Xwidth@#1}\relax\%
\dimen0=\baselineskip
\multiply\dimen0 by 1024
\divide\dimen0 by \columnwidth \multiply\dimen0 by \footfudgefiddle\relax
\csxdef{#1footfudgefactor}{\expandafter\strip@pt\dimen0}

\strip@pt strip the characters pt from a dimen value.
\parafootstart is the same as \normalfootstart, but we give it again to ensure that \rightskip and \leftskip are zeroed (this needs to be done before \parafootgroup in the output routine). The size of paragraphed notes is calculated using a fudge factor which in turn is based on \hsize. So the paragraph of notes needs to be that wide.

The argument of the macro is again the note series letter.

\paravfootnote is a version of the \vfootnote command that is used for paragraphed notes. It gets appended to the \inserts@list list by an outer-level footnote command like \Afootnote. The first argument is the note series letter; the second is the full text of the printed note itself, including line numbers, lemmata, and footnote text.
The initial model for this insertion is, of course, the \insert\footins definition in *The TeXbook*, p. 398. There, the footnotes are first collected up in hboxes, and these hboxes are later unpacked and stuck together into a paragraph.

However, Michael Downes has pointed out that because text in hboxes gets typeset in restricted horizontal mode, there are some undesirable side-effects if you later want to break such text across lines. In restricted horizontal mode, where \TeX does not expect to have to break lines, it does not insert certain items like \discretionary. If you later unbox these hboxes and stick them together, as the *TeXbook* macros do to make these footnotes, you lose the ability to hyphenate after an explicit hyphen. This can lead to overfull \hboxes when you would not expect to find them, and to the uninitiated it might be very hard to see why the problem had arisen.

Wayne Sullivan pointed out to us another subtle problem that arises from the same cause: \TeX also leaves the \language whatsit nodes out of the horizontal list. So changes from one language to another will not invoke the proper hyphenation rules in such footnotes. Since critical editions often do deal with several languages, especially in a footnotes, we really ought to get this bit of code right.

To get around these problems, Wayne suggested emendations to the *TeXbook* versions of these macros which are broadly the same as those described by Michael: the central idea (also suggested by Donald Knuth in a letter to Michael) is to avoid collecting the text in an \hbox in the first place, but instead to collect it in a \vbox whose width is (virtually) infinite. The text is therefore typeset in unrestricted horizontal mode, as a paragraph consisting of a single long line. Later, there is an extra level of unboxing to be done: we have to unpack the \vbox, as well as the hboxes inside it, but that is not too hard. For details, we refer you to Michael’s article, where the issues are clearly explained. Michael’s unboxing macro is called \Xunvxh: unvbox, extract the last line, and unhbox it.

Doing things this way has an important consequence: as Michael pointed out, you really can’t put an explicit line-break into a note built in a \vbox the way we are doing. In other words, be very careful not to use \break, or \penalty-10000, or any equivalent inside your para-footnote. If you do, most of the note will probably disappear. You are allowed to make strong suggestions; in fact \penalty-9999 will be quite okay. Just do not make the break mandatory. We have not applied any of Michael’s solutions here, since we feel that the problem is exiguous, and reledmac is quite baroque enough already. If you think you are having this problem, look up Michael’s solutions.

One more thing; we set \leftskip and \rightskip to zero. This has the effect of neutralizing any such skips which may apply to the main text (cf. XIII.6.2 p. 191 above). We need to do this, since \footfudgefactor is calculated on the assumption that the notes are \hsize wide.

So, finally, here is the modified foot-paragraph code, which sets the footnote in vertical mode so that language and discretionary nodes are included.
Here we produce the contents of the footnote from box 0, and add a penalty of 0 between boxes in this insert.

The final penalty of 0 was added here at Wayne’s suggestion to avoid a weird page-breaking problem, which occurs on those occasions when \TeX attempts to split foot paragraphs. After trying out such a split (see The \TeXbook, p. 124), \TeX inserts a penalty of −10000 here, which nearly always forces the break at the end of the whole footnote paragraph (since individual notes can’t be split) even when this leads to an overfull vbox. The change above results in a penalty of 0 instead which allows, but does not force, such breaks. This penalty of 0 is later removed, after page breaks have been decided, by the \unpenalty macro in \makehboxofhboxes. So it does not affect how the footnote paragraphs are typeset (the notes still have a penalty of −10 between them, which is added by \parafootfmt).

\texttt{\mmparavfootnote} This version is for minipages.
Here is (modified) Michael’s definition of `\unvxh`, used above. Michael’s macro also takes care to remove some unwanted penalties and glue that \TeX automatically attaches to the end of paragraphs. When \TeX finishes a paragraph, it throws away any remaining glue, and then tacks on the following items: a \penalty of 10000, a \parfillskip and a \rightskip (\TeXbook, pp. 99–100). `\unvxh` cancels these unwanted paragraph-final items using \unskip and \unpenalty.

\def\Xunvxh#1#2{\setbox0=\vbox{\unvbox#1}\global\setbox1=\lastbox}\unhbox1\unskip % remove \rightskip,\unskip % remove \parfillskip,\unpenalty % remove \penalty of 10000,\hskip\csuse{Xafternote@#2}\relax}% add the glue to go between the notes

\def\Xparafootfmt#1#2#3#4{\Xstorelineinfo{#1}{#4}\Xinsertparafootsep{#4}\ledsetnormalparstuff@common\printlinefootnote{#1}{#4}\print@lemma{#1}{#2}{#4}\csuse{Xwrapcontent@#4}{#3}\penalty-10 }% add the glue to go between the notes

Note that in the above definition, the penalty of $-10$ encourages a line break between notes, so that notes have a slight tendency to begin on new lines. The \Xstorelineinfo is used to insert the \Xparafootsep@series between each note in the same page.

This footgroup code is modelled on the macros in \TeXbook, p. 399. The only difference is the \unpenalty in `\makehboxofhboxes`, which is there to remove the penalty of 0 which was added to the end of each footnote by `\paravfootnote`.

The call to `\Xnotefontsize@⟨s⟩` is to ensure that the correct `\baselineskip` for the footnotes is used. The argument is the note series letter.
\newcommand*{\parafootgroup}[1]{%  \hsize=\expandafter\dimexpr\csuse{Xwidth@#1}\relax%  \unvbox\csname #1footins\endcsname  \ifcsstring{Xragged@#1}{L}{\RaggedLeft}{}%  \ifcsstring{Xragged@#1}{R}{\RaggedRight}{}%  \makebboxofhboxes  \setbox0=\hbox{\unhbox0 \removehboxes}%  \csuse{Xbhookgroup@#1}%  \csuse{Xnotefontsize@#1}%  \unhbox0\par%  \global\hsize=\old@hsize%}%

%

**Insertion of the footnotes separator** The command \Xinsertparafootsep{⟨series⟩} must be called at the beginning of \parafootftm.
XIII.6.4 Columnar footnotes

Common tools

We will now define macros for three-column notes and two-column notes. Both sets of macros will use \rigidbalance, which splits a box (#1) into a number (#2) of columns, each with a space (#3) between the top baseline and the top of the \vbox. The \rigidbalance macro is taken from *The TeXbook*, p. 397, with a slight change to the syntax of the arguments so that they do not depend on white space. Note also the extra unboxing in \splitoff, which allows the new \vbox to have its natural height as it goes into the alignment.

The \TeX\ line macro has no relationship to the TeX line. The \LaTeX\ equivalent is \@@line.

We do not call directly \rigidbalance, but we call \Xrigidbalance for critical notes and \rigidbalanceX for familiar notes. Both of them call \rigidbalance.

\begin{verbatim}
3443 \newcount\@k \newdimen\@h
3444 \newcommand*{\Xrigidbalance}[3]{%  
3445 \hsize=\expandafter\dimexpr\csuse{Xwidth@\@currentseries}\relax%  
3446 \rigidbalance{#1}{#2}{#3}%
3447 }%
3448 \newcommand*{\rigidbalanceX}[3]{%

\mpthreecolfootsetup{#1}
\fi
%
%
The \footstart and \footnoterule macros for these notes assume the normal values [XIII.6.2 p. 190 above).

\threecolfootsetup The \threecolfootsetup macro calculates and sets some numbers for three-column footnotes.

We set the \count of the foot insert to 333. Each footnote can be thought of as contributing only one third of its height to the page, since the footnote insertion has been made as a long narrow column, which then gets trisected by the \rigidbalance routine (inside \threecolfootgroup). These new, shorter columns are saved in a box, and then that box is put back into the footnote insert, replacing the original collection of the footnotes. This new box is, therefore, only about a third of the height of the original one.

The \dimen value for this note series has to change in the inverse way: it needs to be three times the actual limit on the amount of space these notes are allowed to fill on the page, because when T\TeX is accumulating material for the page and checking that limit, it does not apply the \count scaling.

\mpthreecolfootsetup The setup for minipages.
\threecolvfootnote This is the \vfootnote command for three-column notes. However, most of the code is deported on \threecolvfootnote@inserted. The call to \Xnotefontsize@ ensures that the \splittopskip and \splitmaxdepth take their values from the right \strutbox: the one used in a footnotes. Note especially the importance of temporarily reducing the \hsize to 0.3 of its normal value. This determines the widths of the individual columns. So if the normal \hsize is (say) 10 cm, then each column will be 0.3 \times 10 = 3 cm wide, leaving a gap of 1 cm spread equally between columns (i.e., .5 cm between each).

The arguments are #1 the note series letter and #1 the full text of the note (including numbers, lemma and text).

\threecolvfootnote@inserted This is the threecolfootfmt command that formats one note. The arguments are #1 the line numbers, #2 the lemma and #4 the text of the \footnote command #4 optional (for backward compatibility): the series.

\threecolfootfmt
The `\texttt{\threecol@begin@insert}` contains code used at the beginning of any `\texttt{\insert}` for critical footnotes in three columns. It is used both by `\texttt{\threecolfootfmt}` and by `\texttt{\insert@Xtxtbeforenotes}`.

```latex
\newcommand{\threecol@begin@insert}[1]{%
  \normal@pars
  \nottoggle{Xgroupbyline@#1}{%
    \hsize \csuse{Xhsizethreecol@#1}}%
  \Xsetparindent{#1}%
  \tolerance=5000%
  \Xsethangindent{#1}%
  \@tempdima=\parindent%
  \csuse{Xcolalign@#1}%
  \parindent=\@tempdima%
  \strut%
}%
```

And here is the `\texttt{\threecolfootgroup}` macro that is called within the output routine to regroup the notes into three columns. Once again, the call to `\texttt{\Xnotefontsize@⟨s⟩}` is there to ensure that it is the right `\texttt{\splittopskip}`—the one used in footnotes—which is used to provide the third argument for `\texttt{\rigidbalance}`. This third argument (`\texttt{\@h}`) is the `\texttt{\topskip}` for the box containing the text of the footnotes, and does the job of making sure the top lines of the columns line up horizontally. In *The TeXbook*, p. 398, Donald Knuth suggests retrieving the output of `\texttt{\rigidbalance}`, putting it back into the insertion box, and then printing the box. Here, we just print the `\line` which comes out of `\texttt{\rigidbalance}` directly, without any re-boxing.

```latex
\newcommand*{\threecolfootgroup}[1]{%
  \begingroup%
  \csuse{Xbhookgroup@#1}%
  \csuse{Xnotefontsize@#1}%

\setparindent
\setparindentX

XIII.8  Footnote hanging indent

\sethangindent
\sethangindentX

\sethangindent sets the hangindent for a critical footnote, while \sethangindentX does it for a familiar footnote.
XIII.9 Critical notes presentation

Here, we define some common macros which are used in order to print a critical notes, that is a note with 1) line number 2) lemma 3) lemma separator 4) text associated to the lemma.

XIII.9.1 Font tools

The fonts that are used for printing notes might not have the character mapping we expect: for example, the Computer Modern font that contains old-style numerals does not contain an en-dash or square brackets, and its period and comma are in odd locations. To allow use of the standard footnote macros with such fonts, we use the following macros for certain characters.

The \endashchar macro is simply an en-dash from the normal font and is immune to changes in the surrounding font. The same goes for the full stop. These two are used in \printlines. The right bracket macro is the same again; it crops up in \normalfootfmt and the other footnote macros for controlling the format of the footnotes.

Note that these commands are not directly called by reledmac, but are enclosed as default value of specific hooks. Consequently, people should not redefine them, but use instead the \Xlinearangeseparator, \Xendlinearangeseparator, \Xsublinesep, \Xendsublinesep and \Xlemmaseparator macros.

With polyglossia, each critical note has a \footnote@lang which shows the language of the lemma, and which can be used to switch the bracket from right to left.

\def\endashchar{\textnormal{--}}
\def\fullstop{\textnormal{.}}
\def\Xsublinesep@side{\fullstop}
\newcommand*{\rbracket}{\textnormal{%

    \csuse{Xlemmaseparator@#3}\
    \hskip\csuse{Xafterlemmaseparator@#3}\
  }{%
    \nobreak\hskip\csuse{Xbeforelemmaseparator@#3}\
    \csuse{Xlemmaseparator@#3}\
    \hskip\csuse{Xafterlemmaseparator@#3}\
  }{%
  }%
XIII.9.4 Line number printing

\Xstorelineinfo The \Xstorelineinfo macro is used to store some data about line number of the current critical footnote, data which will be reused later for the \Xnumberonlyfirstinline and related setting.

#1 footnote specification for the current footnote; #2 footnote series.

\newcommand{\Xstorelineinfo}[2]{\l@dp@rsefootspec#1|\iftoggle{Xnumberonlyfirstintwolines@#2}\ldef\lineinfo@{\l@dparsedstartline - \l@dparsedstartsub - \l@dparsedendline - \l@dparsedendsub}{}\xdef\lineinfo@{\l@dparsedstartline - \l@dparsedstartsub}\xdef\lineinfo@{\l@dparsedstartline - \l@dparsedstartsub}}%

\printlinefootnote The \printlinefootnote macro is called in each \textnormal{footfmt} command. It controls whether the line number is printed or not, according to the series options. Its first argument is the information about lines; its second is the series of the footnote. The printing of the line number is shared in \printlinefootnotenumbers.

\newcommand{\printlinefootnote}[2]{\iftoggle{nonum@}{%Try if the line number must printed for this specific not (by default, yes)\hspace{\csuse{Xinplaceofnumber@#2}}}%}{\iftoggle{Xnonumber@#2}%Try if the line number must printed (by default, yes)\hspace{\csuse{Xinplaceofnumber@#2}}%}{\iftoggle{Xnumberonlyfirstinline@#2}% If for this series the line number must be printed only in the first time.\ifscsdef{prevline#2}%\%Be sure the \prevline exists.\ifcsequal{prevline#2}{lineinfo@}%Try it\%\%\iftcsempty{Xsymlinenum@#2}%}{}}
XIII.9  Critical notes presentation

\printsymlinefootnotearea  This macro prints the space before the line symbol, changes the font, when prints the line symbol and the space after it.

\newcommand{\printsymlinefootnotearea}[1]{{%
\hspace{\csuse{Xinplaceofnumber@#1}}%
{\printsymlinefootnotearea[#1]}%
{\\hbox to \csuse{Xboxsymlinenum@#1}{\hfill}}%
\hspace{\csuse{Xaftersymlinenum@#1}}%}
}%

\printlinefootnotearea  This macro prints the space before the line number, changes the font, then prints the line number and the space after it. It is called by \printlinefootnote depending of the options about repeating line numbers. The first argument is line information, the second is the notes series (A, B, C, etc.)

\newcommand{\printlinefootnotearea}[2]{{%
\printXbeforenumber{#2}%
{\csuse{Xnotenumfont@#2}}%
{\boxfootnotenumbers{#1}{#2}}%
\printXafternumber{#2}%
}%
}%
\boxfootnotenumbers Depending on the user settings, this macro will box line numbers (or not). The first argument is line information, the second is the notes series (A, B, C, etc.) The previous \printlinefootnotenumbers calls it.

\newcommand{\boxfootnotenumbers}{2}{% 
\ifdefequal{\csuse{Xboxlinenum@#2}}{0pt}{% 
  \printlinefootnotenumbers{#1}{#2}%
}
{%
  \hbox to \csuse{Xboxlinenum@#2}%

}\iftoggle{Xstanza@#2}{}{\csuse{Xstanzaseparator@#2} %
  \ifnumberstanza\printstanza\csuse{Xstanzaseparator@#2} %
}\% %
%
\printXbeforenumber This macro prints a space (before the line number) in footnote. It is called by \printlinefootnotearia. Its only argument is the note series (A, B, C, etc.)

\newcommand{\printXbeforenumber}{1}{% 
\hspace{\csuse{Xbeforenumber@#1}}%
%
XIII.9  Critical notes presentation

\printXafternumber  This macro prints the space, adding eventually a \nobreak, after the line number, in footnote. It is called by \printlinefootnotearea. Its only argument is the series

\newcommand{\printXafternumber}{1}{%\iftoggle{Xnonbreakableafternumber@#1}{\nobreak}{%\hspace{\csuse{Xafternumber@#1}}}%}%%}

If we have decided to print the line number in a specific notes, the \printlines macro prints the line numbers for a note—which, in the general case, is a rather complicated task. The seven parameters of the argument are the line numbers as stored in \l@d@nums, in the form described on V.9 p. 109: the starting page, line, and sub-line numbers, followed by the ending page, line, and sub-line numbers, and then the font specifier for the lemma.

edmac' creator have defined six boolean in order to know which component of line number description we have to print:

- \ifl@d@pnum for page numbers;
- \ifl@d@ssub for starting sub-line;
- \ifl@d@elin for ending line;
- \ifl@d@esl for ending sub-line; and
- \ifl@d@dash for the dash between the starting and ending groups.

There is no boolean for the line number because it is always printed.

Maïeul Rouquette has added \ifl@d@Xtwolines and \ifl@d@Xmorethantwolines to print a symbol which stands for “and subsequent” when there are two, three or more lines. Is also defines \@annot@start@print and \@annot@end@print which define annotations associated with the starting and ending line numbers in critical footnotes.

\newif\ifl@d@pnum
\newif\ifl@d@ssub
\newif\ifl@d@elin
\newif\ifl@d@esl
\newif\ifl@d@dash
\newif\ifl@d@Xtwolines
\newif\ifl@d@Xmorethantwolines
\let\@annot@start@print\relax
\let\@annot@end@print\relax
%\l@dparsefootspec{⟨spec⟩}{⟨lemma⟩}{⟨text⟩} parses a footnote specification. ⟨lemma⟩ and ⟨text⟩ are the lemma and text respectively. ⟨spec⟩ is the line and page number and lemma font specifier in \l@d@nums style format. The real work is done by \l@d@parsefootspec which defines macros holding the numeric values. In many cases,
this last command is called directly. Just a reminder of the arguments:
\printlines #1 | #2 | #3 | #4 | #5 | #6 | #7
\printlines start-page | line | subline | end-page | line | subline | fontflag
\newcommand*{\l@dparsefootspec}[3]{\l@dparsefootspec#1|}

If the \texttt{\Xnoidenticallinenumannotation} is set for this series, we check if the ending annotation is identical to the starting. If true, we don't print the ending annotation:

\begin{verbatim}
\iftoggle{\Xnoidenticallinenumannotation\@currentseries}{%
  \iftoggleannot\start\annot\end%
    \let\annot\end\print\relax%
    \iftoggle\linenumrep\gobble\%\!
      \do{\textcolor{red}{Dash}}
    \fi%
    \do{\textcolor{red}{Dash}}
  \fi%
}\%
\end{verbatim}

Finally, we check for \texttt{\Xlinenumannotationonlyfirst} and \texttt{\Xlinenumannotationonlyfirstintwo}, and we redefine, if required, \texttt{\annot\start\print} and \texttt{\annot\end\print}. We also store the current line number annotations:

\begin{verbatim}
\iftoggle{\Xlinenumannotationonlyfirst\@currentseries}{%
  \ifboolexpr{\%}
    \not\Xlinenumannotationonlyfirstintwo\@currentseries\%
    and \texttt{\iftoggleannot\start\annot\end\{\prevannot\start\}@\currentseries\}\
    and \texttt{\iftoggleannot\end\{\prevannot\end\}@\currentseries\}\
  \)
  or%
  \%
  \not\Xlinenumannotationonlyfirstintwo\@currentseries\%
  test{\iftoggleannot\start\{\prevannot\start\}@\currentseries\}\
  \}
  \%
\}\
\def\annot\start\print{\textcolor{red}{\do{\textcolor{red}{Dash}}}\textcolor{red}{\do{\textcolor{red}{Dash}}}\%\!}\}\texttt{\Xlinenumrep\gobble}\%
\end{verbatim}
The \ifistwofollowinglines boolean, used by the \Xtwolines and related setting, is set to true by \setistwofollowinglines. This command takes the following arguments:

- #1 First page number.
- #2 First line number.
- #3 Last page number.
- #4 Last line number.

If #3 - #2 = 1, then that means the two lines are subsequent, and consequently \ifistwofollowinglines is set to true. However, if we use lineation by page, two given lines can be subsequent if:

- The first line number is equal to the last line number of the first page.
- The last line number is equal to 1.
- #3 - #1 is equal to 1.
So, we have decided which part of line number sets will be printed depending on the value. Now we are ready to print them. If the lineation is by pstart, we print the pstart. Arguments are 1) start page number 2) start line number 3) start subline number 4) end page number 5) end line number 6) end subline number 7) font specification 8) side flag

\def\printlines#1|#2|#3|#4|#5|#6|#7|#8|{
  \begingroup
  Decide which part of line number components we will print.
  \setprintlines{#1}{#2}{#3}{#4}{#5}{#6}
  One subtlety left here is when to print a period between numbers. But the only instance in which this is tricky is for the ending sub-line number: it could come after the starting sub-line number (in which case we want only the dash) or after an ending line number (in which case we need to insert a period). So, first, print the start line number.

  \ifdimequal{\csuse{Xboxstartlinenum@\@currentseries}}{0pt}{\bgroup}{\leavevmode\hbox to \csuse{Xboxstartlinenum@\@currentseries}\bgroup\hfill}
  \ifcsstring{Xlinenumannotationposition@\@currentseries}{before}{\@annot@start@print}{\}
  \ifl@pnum\wrap@edcrossref{\@this@crossref@start}{#1}\csuse{Xpagelinesep@\@currentseries}\fi\wrap@edcrossref{\@this@crossref@start}{\linenumrep{#2}}\iftoggle{Xlineflag@\@currentseries}{#8}{\}
  \ifl@dssub\csuse{Xsublinesep@\@currentseries}\wrap@edcrossref{\@this@crossref@start}{\sublinenumrep{#3}}\fi
  \ifcsstring{Xlinenumannotationposition@\@currentseries}{after}{\@annot@start@print}{\}
  \egroup
  Then print the dash + end line number, or the range symbol.
XIII.9 Critical notes presentation

XIII.9.5 Footnote grouped by line

\prepare@Xgroupbyline is a macro called on the \metaXXXvfootnote if \Xgroupbyline is set to true, instead of calling \insert directly. #1 The series
#2 The content of the footnote, which is also the line number indication
#3 This macro, which prepares the contents of the insertion

\newcommand{\prepare@Xgroupbyline}[3]{% 
  \iftoggle{Xgroupbylineseparetwolines@#1}{%

XIV Familiar footnotes

XIV.1 Adjacent footnotes

The original edmac provided users with five series of critical footnotes (\Afootnote \Bfootnote \Cfootnote \Dfootnote \Efootnote), and \LaTeX provides a single numbered footnote. The \reledmac package uses the edmac mechanism to provide six series of numbered footnotes.

First, though, the \footmisc package has an option whereby two or more consecutive \footnote(s) have their marks separated by commas. This seemed to Peter Wilson such a useful ability that it was provided automatically by \eledmac.

Maïeul Rouquette has maintained this feature in \reledmac, despite he thought that is not directly in relationship with the aim of \reledmac.

These macros may have been defined by the memoir class, are provided by the \footmisc package and perhaps by other footnote packages. That is why we use \providecommand and not \newcommand.

A pair of self-cancelling kerns. This may have been defined in the memoir class.
\providecommand*{\m@mmf@prepare}{% 
\kern-\multiplefootnotemarker 
\kern\multiplefootnotemarker\relax}
%

\m@mmf@check  This may have been defined in the memoir class. If it recognises the last kern as \multiplefootnotemarker it typesets \multfootsep.

\providecommand*{\m@mmf@check}{% 
\ifdim\lastkern=\multiplefootnotemarker\relax 
\edef\@x@sf{\the\spacefactor}% 
\unkern 
\multfootsep 
\spacefactor\@x@sf\relax 
}\fi}
%

We have to modify \@footnotetext and \@footnotemark. However, if memoir is used the modifications have already been made.

\@ifclassloaded{memoir}{% 
%
\@footnotetext  Add \m@mmf@prepare at the end of \@footnotetext.

\apptocmd{\@footnotetext}{\m@mmf@prepare}{}{}
%

\@footnotemark  Modify \@footnotemark to cater for adjacent \footnote.

\patchcmd{\@footnotemark}{\{\nobreak}{}
\patchcmd{\@footnotemark}{\m@mmf@check}\nobreak 
}\{\}
\patchcmd{\@footnotemark}{\{\@makefnmark}{}
\patchcmd{\@footnotemark}{\m@mmf@prepare}{}{}
%

Finished the modifications for the non-memoir case.

} 
XIV.2 Regular footnotes for numbered texts

In order to enable the regular \footnotes in numbered text we have to play around with its \footnotetext, using different forms for when in numbered or regular text.

\footnotetext{In order to enable the regular \footnotes in numbered text we have to play around its \footnotetext, using different forms for when in numbered or regular text.}

\footnote{In order to enable the regular \footnotes in numbered text we have to play around its \footnotetext, using different forms for when in numbered or regular text.}

\setcounter{footnote}{0}
\renewcommand{\footnotemark}{\thefootnote}
\renewcommand{\footnotetext}[1]{\footnotesize #1}
\renewcommand{\footnoterule}{\hrule width\textwidth}

\begin{itemize}
\item \footnote{In order to enable the regular \footnotes in numbered text we have to play around its \footnotetext, using different forms for when in numbered or regular text.}
\item \footnote{In order to enable the regular \footnotes in numbered text we have to play around its \footnotetext, using different forms for when in numbered or regular text.}
\end{itemize}

\begin{thebibliography}{10}
\bibitem{example}
In order to enable the regular \footnotes in numbered text we have to play around with its \footnotetext, using different forms for when in numbered or regular text.\end{thebibliography}
XIV.3 Footnote formats

Some of the code for the various formats is remarkably similar to that in section ??.

The following macros generally set things up for the ‘standard’ footnote format.

\prebodyfootmark Two convenience macros for use by \...@footnotemark... macros.
\postbodyfootmark

\newcommand*{\prebodyfootmark}{%  
  \leavevmode  
  \ifhmode  
  \edef\@x@sf{\the\spacefactor}%  
  \m@mmf@check  
  \nobreak  
  \fi}  
\newcommand{\postbodyfootmark}{%  
  \m@mmf@prepare  
  \ifhmode\spacefactor\@x@sf\fi\relax}%

XIV.4 Footnote arrangement

XIV.4.1 User level macro
\arrangementX \arrangementX[⟨s⟩]{⟨arrangement⟩} command calls, for each series, a specific command which set many counters and commands in order to define specific arrangement.

\newcommand{x}{\arrangementX}[2][1,usedefault]{%  
  \def\do##1{%  
    \csname arrangementX@#2\endcsname{##1}%  
  }%  
  \ifstrempty{#1}%  
  {%  
    \dolistloop{@series}%  
    \docsvlist{#1}%  
  }%  
}%
%

XIV.4.2 Normal footnotes
\normal@footnotemarkX \normal@footnotemarkX{⟨series⟩} sets up the typesetting of the marker at the point where the footnote is called for.

\newcommand*{\normal@footnotemarkX}{[1]{%  
  \prebodyfootmark  
  \wrapped@bodyfootmarkX{#1}%  
  \postbodyfootmark}
The \normalbodyfootmarkX\{(series)\} really typesets the in-text marker. The style is the normal superscript.

\newcommand*{\normalbodyfootmarkX}[1]{
  \ hbox{\textsuperscript{\normalfont\@nameuse{@thefnmark#1}}}
}

\normalvfootnoteX \normalvfootnoteX\{(series)\}{\langle text \rangle} does the \insert for the \langle series \rangle and calls the series' \footfmt... to format the \langle text \rangle.

    \hyperlink%\
    \@nameuse{bodyfootmark#1}\expandafter\the\csname footnote#1@reading\endcsname}%\
  \Hy@raisedlink{%
XV Code common to both critical and familiar footnote in normal arrangement

par should always be redefined to endgraf within the format macro (this is what normal@pars does), to override tricky material in the main text to get the lines numbered automatically (as set up by autopar, for example).

In the case of footnote arranged in a “normal” way, we also must set some setting for paragraph indent and text direction when using LuaLaTeX.

That why we have defined \ledsetnormalparstuff@common in order to make this setting for both familiar and critical notes. This command is called by command to make specific setting to critical or familiar footnote.
XVI  Footnotes’ width for two columns

We define here some commands which make sense only with \texttt{reledpar}, but must be called when defining notes parameters. These commands change the width of block notes to allow them to have the same size than two parallel columns.

\begin{verbatim}
\old@hsize
\setXnoteswidthliketwocolumns@
\setnoteswidthliketwocolumnsX@
\end{verbatim}

These two commands are called at the beginning of critical or familiar notes groups. They set, if the option is enabled, the \texttt{hsize}. They are also called at the on the setup for paragraphed notes.

\begin{verbatim}
\newdimen\old@hsize
\AtBeginDocument{\old@hsize=\hsize}%
\newcommand{\setXnoteswidthliketwocolumns@}[1]{%
  \global{\let\hsize@fornote=\hsize%}
  \global{\old@hsize=\hsize%}
  \let\old@columwidth=\columnwidth%
  \iftoggle{Xnoteswidthliketwocolumns@#1}{%
    \setwidthliketwocolumns%
    \global{\let\hsize@fornote=\hsize%}
  }{
    }
  \let\hsize=\hsize@fornote%
  \let\columnwidth=\old@columwidth%
}%
\newcommand{\setnoteswidthliketwocolumnsX@}[1]{%
  \global{\let\hsize@fornote=\hsize%}
  \global{\old@hsize=\hsize%}
  \let\old@columwidth=\columnwidth%
  \iftoggle{noteswidthliketwocolumnsX@#1}{%
    \setwidthliketwocolumns%
    \global{\let\hsize@fornote=\hsize%}
  }{
    }
  \let\hsize=\hsize@fornote%
  \let\columnwidth=\old@columwidth%
}%
\end{verbatim}

These two commands set the position of the critical / familiar footnotes, depending on the hooks \texttt{Xnoteswidthliketwocolumns} and \texttt{noteswidthliketwocolumnsX}. They call commands which are defined only in \texttt{reledpar}, because this feature has no sens without \texttt{reledpar}.

\begin{verbatim}
\setXnotespositionliketwocolumns@
\setnotesXpositionliketwocolumns@
\end{verbatim}

XVII Footnotes’ order

The \fnpos and \mpfnpos simply place their arguments in \@fnpos and \@mpfnpos, which will be used later in the output routine.

XVIII Footnotes’ rule

Because the footnotes’ rules can be shifted to the right when footnotes are set like two columns, we do not print them directly, but we put them in a \vbox.
XIX Specific skip for first series of footnotes

XIX.1 Overview

\texttt{\textbackslash beforenotes} inserts a specific skip for the first series of notes in a page. As we can’t know in advance which series will be the first, we call \texttt{\textbackslash prepare@Xprenotes} before inserting any critical notes in order to prevent page number overlapping.

1. If it is the first note of the current page, it changes the footnote skip for the series to the value specified to \texttt{\textbackslash beforenotes}. It also keeps the series of the note as the first one of the current page.

2. If it is not the first note of the current page:
   - If the current series is printed after the series kept as the first of the current page, then nothing happens.
   - If the current series is printed before the series kept as the first of the current page, then it changes the footnote skip of the current series to the value normally used by the series which was marked as the first of the page. It also keeps the current series as the new first one of the current page.

For example, suppose the series order is A,B. We call first a \texttt{\textbackslash Bfootnote} and a \texttt{\textbackslash Afootnote}. The only skips used are, finally, the skip specific to the first series of the page, and the skip for the B series. If we have not called \texttt{\textbackslash Afootnote}, the only skip used is the skip specific to the first series of the page.

That is perfect.

The series skip and the first series of the current page are reset before the footnotes are printed. Then, the footstart macros manage the problem of the first series of the page.

After the rule, the space which is defined by \texttt{\textbackslash afterrule} does not depend on whether the series is the first one of the page or not. So we use its normal value for each series.

And now, implementation!

XIX.2 User level command

\begin{verbatim}
\Xprenotes@ \Xprenotes
If user redefines \Xprenotes@, via \texttt{\textbackslash Xprenotes} to a value greater than 0 pt, this skip will be added before first series notes instead of the notes skip.
\end{verbatim}

The same, but for familiar footnotes.
The same thing is required for familiar notes and \
\texttt{prenotesX}. 

\texttt{firstseriesX0}\% 
\texttt{prepare@prenotesX}\% 
\texttt{firstseriesX0}{} 
\texttt{prepare@prenotesX}{} 
\texttt{firstseriesX0}{\%} 
\texttt{prepare@prenotesX}{\%}
XX Endnotes

First, check the noend option.

\ifbool{noend@}{%Used instead of \ifnoend@ to prevent expansion problem
\%

XX.1 Internal commands

\l@dend@open and \l@dend@close are the macros that are used to open and close the endnote file. Note that all our writing to this file is \emph{\texttt{\texttt{immediate}}} all page and line numbers for the endnotes are generated by the same mechanism we use for the footnotes, so that there is no need to defer any writing to catch information from the output routine. The argument of these two command is the series letter.

\newcommand{\l@dend@open}{[1]{% \global\booltrue{\l@dend@#1}% \expandafter\immediate\expandafter\openout\csname l@d@#1end\endcsname\relax}% \% \newcommand{\l@dend@close}{[1]{% \global\boolfalse{\l@dend@#1}% \expandafter\immediate\expandafter\closeout\csname l@d@#1end\endcsname% }% \% \%

\l@dend@stuff \l@dend@stuff is used by \texttt{\texttt{\texttt{\texttt{\texttt{beginnumbering}}}}} to do everything that is necessary for the endnotes at the start of each section: it opens the \l@d@end file, if necessary, and writes the section number to the endnote file.

\newcommand{\l@dend@stuff}{% \def\do##1{%
The \endprint here is nearly identical in its functioning to \normalfootfmt.

The endnote file also contains \l@d@section commands, which supply the section numbers from the main text; standard reledmac does nothing with this information, but it is there if you want to write custom macros to do something with it. Arguments are:

- **#1** Line numbers and font selection.
- **#2** Lemma.
- **#3** Note content.
- **#4** Series.
- **#5** Optional argument of \Xendnote.
- **#6** Side (L or R).
- **#7** Label for cross-referencing.
The \Xendstorelineinfo macro is used to store some data about line number of the current critical endnote, data which will be reused later for the \Xnumberonlyfirstinline and related setting.

\newcommand{\Xendstorelineinfo}[2]{% 
\def\do##1{% 
\setkeys[mac]{truefootnoteoption}{##1}% 
\notblank{#5}{\docsvlist{#5}}{}% 
\IfStrEq{#6}{R}{\ledRcol@true}{}%

\section{User level commands}

\subsection{Inserting contents to endnotes}

The \texttt{\Xendnotes} commands are defined above, when defining apparatus commands by series. Here, we define only \texttt{\toendnotes} command not specific to a series, in order to insert arbitrary code. The regular version writes an unexpanded argument, while the regular version writes a once-expanded argument.

\newcommandx{\toendnotes}[2][1, usedefault]{% 
  \ifboolexpr{bool{numbering} or bool{numberingR}}{% 
    \def\do##1{% 
      \expandafter\immediate\expandafter\write\csname l@d@##1end\endcsname{\unexpanded{#2}@percentchar}% 
    }% 
    \ifstrempty{#1}{}{}
  }{% 
    \le@err@toendnotes@outsidenumbering
  }% 
}
XX.2.2 Printing endnotes

\doendnotes is the command you use to print one series of endnotes; it takes one argument: the series letter of the note series you want to print. \Xendinsertsep@ is set to true at the first note of the series, and to false at the last one.

\ifXendinsertsep@
\doendnotes
\fi

\doendnotesbysection is a variant of the previous macro. While \doendnotes print endnotes for all of numbered sections \doendnotesbysection print the endnotes for the first numbered section at its first call for a series, then for the second section at its second call for the same series, then for the third section at its third call for the same series, and so on.

\doendnotesbysection
We close now the conditional period, which depends on \ifnoend, because the following commands can be used by other commands than those specific to endnotes.

\setprintendlines

The \printendlines macro is similar to \printlines but is for printing endnotes rather than footnotes.

The principal difference between foot- and endnotes is that footnotes are printed on the page where they are specified but endnotes are printed at a different point in the document. We need an indication of the source of an endnote; \setprintendlines provides this by always printing the page number. The coding is slightly simpler than \setprintlines.

from the starting page number.

First of all, we print the second page number only if the ending page number is different

We print the ending line number if: (1) we are printing the ending page number, or (2) the ending line is different from the starting line number.
We define the starting line number annotation as a merge of the starting annotation and ending annotation if we don’t print the ending line number. Otherwise, it is only the starting annotation.
We print the starting sub-line if it is nonzero.

```

\expandafter\newcount\csname #1prevpage@numR\endcsname
\end{verbatim}

We need to be able to modify \texttt{reledmac}'s footnote macros and restore their

\begin{verbatim}
\global\csletcs{#1@@footnote}{#1footnote}
\end{verbatim}

\subsubsection{XXI.3.4 Set standard display}

\begin{verbatim}
\Xarrangement@normal{#1}
\end{verbatim}

End of for critical footnotes.

\begin{verbatim}
\fi
\end{verbatim}

\subsubsection{XXI.4 For familiar footnotes}

Familiar footnotes are those which end with letters. We look for the \texttt{nofamiliar} option of \texttt{reledmac}.

\begin{verbatim}
\unless\ifnofamiliar@
\end{verbatim}

\subsubsection{XXI.4.1 Options}

\begin{verbatim}
\newtoggle{parindentX@#1}
\csgdef{wrapcontentX@#1}{}
\csgdef{hangindentX@#1}{Opt}%
\csgdef{beforeinsertingX@#1}{}
\csgdef{raggedX@#1}{}
\end{verbatim}
For familiar footnotes (\footnoteX)

First, create the \footnoteX command. Note the double # in command: it is because a command is called inside another command.

\global\expandafter\newcommand\csname footnote#1\endcsname[2][2]{%  
\begingroup%  
\prepare@prenotesX{#1}%  
\newcommand\content{##2}%  
\ifdefined\csq@qlevel%  
\csq@qlevel=0\relax%  \fi%  
\endgroup%}

If we are using the \csquotes package, we reset the quotation level.

\ifdefined\csq@qlevel1%  \csq@qlevel=0\relax% \fi%

If we are preparing parallel typesetting, we cannot just increase the footnote counter. Read \reledpar’s handbook about that \textit{V.1.2 p. 54}. If we have a manual footnote mark, use it.

\global\expandafter\advance\csname footnote#1\endcsname by \@ne%
We also have to check consistency with \onlysideX setting.

And now, the feature not depending on whether we are preparing parallel typesetting

m@mmfprepare% \ifbool{indtl@innote}% \let\index\orig@@index% \% \ifbool{indtl@notenumber}% \let\index\orig@@index% \% \endgroup%
Then define the counters. The \TeX\ counter \texttt{footnoteX} is the only one manipulated by the user. This is the one which is printed. The \TeX\ counter \texttt{\footnotemark@reading} is increased at each footnote. It is used for hyperlinks, for using the \texttt{hyperlink} package, and for getting the correct footnote number when using parallel typesetting (V.1.2 p. 54).

\begin{verbatim}
\newcounter{footnote#1}
\global\expandafter\renewcommand\csname thefootnote#1\endcsname{\arabic{footnote#1}}
\expandafter\newcount\csname footnote#1@reading\endcsname
% Create counter used to determine on which page the previous note was called.
\expandafter\newcount\csname prevpage#1@num\endcsname
\expandafter\newcount\csname prevpage#1@numR\endcsname
% Add \let\footnoteX\@gobble to \no@expands.
\expandafter\gappto\expandafter\no@expands\expandafter{{\expandafter\let\csname footnote#1\endcsname\@gobble}}%
% And now, define \texttt{\footnoteXmark} and \texttt{\footnoteXtext}, equivalent to classical \texttt{\footnotemark} and \texttt{\footnotetext}.
\expandafter\newcommand\csname footnote#1mark\endcsname[1][1]{%
  \begingroup
  \prepare@prenotesX{#1}
  \ifstreempty{##1}{%
    \stepcounter{footnote#1}%
  }{%
    \setcounter{footnote#1}{##1}%
  }
  \protected@csxdef{@thefnmark#1}{\csuse{thefootnote#1}}%
  \csuse{@footnotemark#1}%
  \m@mmf@prepare%
  \endgroup%
}%
\expandafter\newcommand\csname footnote#1text\endcsname[2][1]{%
  \begingroup
  \csuse{vfootnote#1}{#1}{\expandonce{##2}}{##1}%
  \endgroup%
}%
% Do not forget to initialize the series.
\arrangementX@normal{#1}%
\fi%
\end{verbatim}
XXI.5 The endnotes

Endnotes are commands like \Xendnote, where X is a series letter. First, we check for the noend options.

\unless\ifnoend@
  \% 
\begin{verbatim}
XXI.5.1 The auxiliary file

Endnotes of all varieties are saved up in a file, one by series, typically named ⟨jobname⟩.Xend. \@dend is the output stream number for this file, and \ifdendX is a flag that is true when the file is open.

\expandafter\newwrite\csname l@d@#1end\endcsname\%
\expandafter\newif\csname ifl@dend@#1\endcsname\%
\% 

XXI.5.2 The main macro

The \Xendnote macro functions to write one endnote to the .Xend file. We change \newlinechar so that in the file every space becomes the start of a new line; this generally ensures that a long note does not exceed restrictions on the length of lines in files.

\global\expandafter\newcommandx\csname #1endnote\endcsname[2][1, usedefault]{% 
  \bgroup
  \newlinechar='40%
  \global\@noneed@Footnotetrue%
  \newcommand{\content}{##2}%

    {#1}%
    \unexpanded{\if\sw@list@inedtext\fi}%
    \\ifledRcol R\else L\fi}%
    \theedtext}%
  \@percentchar%
}\%
XXI.5 The endnotes

XXI.5.3 Tools

The \Xtoendnotes command inserts any arbitrary content into the endnote file. It is an alias of the more generalist \addtoendnotes

\global\expandafter\newcommand\csname #1toendnotes\endcsname[1]{\toendnotes[#1]{##1}}

\expandafter\WithSuffix\expandafter\newcommand\csname #1toendnotes\endcsname*[1]{\toendnotes*[#1]{##1}}

We need to store the number of times \doendnotesbysection is called for one series.

\global\cslet{#1end}{\@gobbleseven}

\global\expandafter\newcount\csname #1end@bysection\endcsname

XXI.5.4 Internal commands

\Xendnote commands called \Xend commands on to the endnote file; these are analogous to the various \footfmt commands above, and they take the same arguments. When we process this file, we want to pick out the notes of one series and ignore all the rest. To do that, we equate the end command for the series we want to \endprint, and leave the rest equated to \@gobbleseven, which just skips over its seven arguments.

\global\cslet{#1end}{\@gobbleseven}

We need to store the number of times \doendnotesbysection is called for one series.

\global\expandafter\newcount\csname #1end@bysection\endcsname

XXII  Setting series display

XXII.1  Change series order

\seriesatbegin\{#1\} changes the order of series, to put the series #1 at the beginning of the list. The series can be the result of a command.
\newcommand{\seriesatbegin}[1]{\%
  \StrDel{@series}{#1}@series\%
  \edef{@series}\%
}
\seriesatend  And \seriesatend moves the series to the end of the list.

\ifseriesbefore  \ifseriesbefore{⟨seriesA⟩}{⟨seriesB⟩}{⟨true⟩}{⟨false⟩} expands to ⟨true⟩ if ⟨seriesA⟩ is printed before ⟨seriesB⟩, or to ⟨false⟩ otherwise.

\@getfirstseries  \@getfirstseries

\numberonlyfirstinline  XXII.3 Series setting

XXII.3.1 General way of working

The setting’s command (like \numberonlyfirstinline), also called “hooks” can be divided in two categories: those which require a string value and those which require a boolean value. The first category includes those which require a length value, because
we store the length’s expression send by user and we evaluate it only in the commands which requires to know the setting. The second category require boolean value only when it is set to FALSE. Otherwise, we understand the insinuated value is TRUE.

For each “hook” command, we store the value in commands (first category) or a etoolbox’s toggle (second category) which names are in the form \<hook>@<series>. For example, when calling \twolines{⟨sq.⟩}, we store sq. in commands \twolinesA, \twolinesB, \twolinesC... for each series defined for use with reledmac, or, if the [(series)] optional argument was send, for each series of this argument.

These values are tested in some specific places, scattered in all the code, depending of their effects. The default values are defined by the \newseries@ command.

In order to prevent code duplication, we have created some generic commands. Some of them change the value of any hook send as argument. Some other, getting a hook name, generate the user level commands.

**XXII.3.2 Tools to set options**

\settogglename{series}{(series)}{(toggle)}{(value)} is a generic command to switch toggles for some series. The arguments are:

- #1 (mandatory): the series for which the hooks should be set. If empty, all the series will be affected.
- #2 (mandatory): the name of the hook.
- #3 (mandatory): the new value of toggle (true or false).
- #4 (optional): if equal to reload, reload the footnote setting (call again \Xarrangement or \arrangementX or ... depending of the footnote display).
- #5 (optional): if not empty, and if #1 is empty, change the hook setting for pseudo-series, as appref.

```latex
\newcommandx[5]{\settogglename}{[4,5,usedefault]}{%
  \global\settogglename{#2}{#3}{#4}{#5}
  \ifstrequal{#4}{critical}{%\csuse{Xarrangement@\csuse{series@display##1}}{##1}{%\}{}\ifstrequal{#4}{familiar}{%\csuse{arrangementX@\csuse{series@displayX##1}}{##1}{%}{%}
  }{%\ifstrempty{#1}{%\dolistloop{@series}%\ifstrempty{#5}{}{%\docsvlist{#5}{}
}{}\}{}
```

\setcommand@series \setcommand@series\{series\}\{\{command\}\{\{value\}\}\} is a generic command to store a hook’s value into commands specific to some series. The arguments are:

- #1 (mandatory): the series for which the hooks should be set. If empty, all the series will be affected.
- #2 (mandatory): the name of the hook.
- #3 (mandatory): the new value of the hook/command.
- #4 (optional): if equal to reload, reload the footnote setting (call \footnormal or \footparagraph or ... depending of the footnote display).
- #5 (optional): if not empty, and if #1 is empty, change the hook setting for pseudo-series, as appref.

\newcommandx{\setcommand@series}[5][4,5,usedefault]{%
  \def\do##1{\csgdef{#2@##1}{#3}
  \ifstrequal{#4}{critical}{% \csuse{Xarrangement@\csuse{series@display##1}}{##1} % }{}
  \ifstrequal{#4}{familiar}{% \csuse{arrangementX@\csuse{series@displayX##1}}{##1} % }{}
  }%
  \ifstrempty{#1}{% \dolistloop{@series}%
  \ifstrempty{#5}{% \dosvlist{#5} % }%
  }%
  %
%
XXII.3.3 Tools to generate options commands

\newhookcommand@series \newhookcommand@series\command names is a generic command to add new commands for hooks, like \Xhsizetwocol. The first argument is the name of the hook, the second a comma-separated list of pseudo-series where the hook can be used, like appref in the case of \Xtwolines. The second argument is also used to create commands named \<hookname><pseudoseries>, like \Xtwolinesappref.
XXII.3 Series setting

%
\newhooktoggle@series
\newhooktoggle@series\command names is a generic command to add new commands for a new toggle hook, like \Xnumberonlyfirstinline. The second argument is also used to create commands named \langle\hookname\rangle<pseudoseriestag>, like \Xtwolinesbutnotmoreappref.

\newcommandx{\newhooktoggle@series}{2}[2,usedefault]{%
\global\expandafter\newcommandx\expandafter*\csname #1\endcsname[2][1,2={true},usedefault]{%
\settoggle@series{##1}{#1}{##2}[#2]%
}}%
\ifstrempty{#2}{}{%
\def\do##1{%
\global\expandafter\newcommand\expandafter*\csname #1##1\endcsname{%
\csuse{#1}[]}%
}else{
\docsvlist{#2}%

}%
%
\newhooktoggle@series@reload
\newhookcommand@toggle@reload does the same thing as \newhooktoggle@series but the commands created by this macro also reload the series arrangement, depending on type of notes

\newcommand{\newhooktoggle@series@reload}[2]{%
\global\expandafter\newcommand\expandafter*\csname #1\endcsname[2][1,2={true},usedefault]{%
\settoggle@series{##1}{#1}{##2}[]}%
}%

ewhookcommand@series@reload does the same thing as \newhookcommand@series but the commands created by this macro also reload the series' arrangement.

XXII.3.4 Options for critical notes

Before generating the commands that are used to set the critical notes, such as \Xnumberonlyfirstinline, \Xlemmaseparator and the like, we check the nocritical option.
Now, hooks for critical notes which also apply to crossreferencing and line numbering at the sides of the page.

XXII.3.5 Options for familiar notes

Before generating the optional commands for familiar notes, we check the `nofamiliar` option.

```
unless\nofamiliar@
  \newhookcommand@series\{wrapcontentX\}
  \newhookcommand@series\{beforeinsertingX\}
  \newhooktoggle@series\{parindentX\}
  \newhookcommand@series\{hangindentX\}
  \newhookcommand@series\{raggedX\}
  \newhookcommand@series\{hsizetwocolX\}
  \newhookcommand@series\{hsizethreecolX\}
  \newhookcommand@series\{colalignX\}
  \newhookcommand@series\{notenumfontX\}
  \newhookcommand@series\{bhooknoteX\}
  \newhookcommand@series\{bhookgroupX\}{familiar}
  \newhookcommand@series\{beforenotesX\}{familiar}
  \newhookcommand@series\{maxhnotesX\}{familiar}
  \newhookcommand@series\{noteswidthliketwocolumnsX\}{familiar}
  \newhookcommand@series\{afterruleX\}{familiar}
  \newhookcommand@series\{notefontsizeX\}{familiar}
  \newhookcommand@series\{afternoteX\}
  \newhookcommand@series\{parafootsepX\}
  \newhookcommand@series\{txtbeforenotesX\}
  \newhookcommand@series\{txtbeforenotesonlyonceX\}
  \newhookcommand@series\{widthX\}{familiar}
  \ifdef\{\hsizeX\}
    \newcommand\{\hsizeX\}[2][1,usedefault]{\widthX[#1]{#2}}
  \else
    \widthX[#1]{#2}
  \fi
\fi
```

XXII.3.6 Options for endnotes

Before generating the commands that are used to set the endnotes, such as `Xnumberonlyfirstinline`, `XlemmasePARATOR+` and the like, we check the `noend` option.

```
unless\noend@
  \newhookcommand@series\{Xendwraplemma\}
```
XXII.3  Series setting

XXII.4 Hooks for a particular footnote

\newhooktoggle@specific

\newhooktoggle@specific is a generic command to create boolean hook specific to a note.

\newcommand{\newhooktoggle@specific}[1]{%
\newtoggle{#1@}%
\listgadd{\hooktoggle@specific}{#1}%
\define@key[mac]{truefootnoteoption}{#1}{\global\settoggle{#1@}{true}}% When enabling footnote option
\define@key[mac]{falsefootnoteoption}{#1}{\global\settoggle{#1@}{false }}%
}%
%
%

\newhookarg@specific

\newhookarg@specific is a generic command to create argument hook specific to a note.

\newcommand{\newhookarg@specific}[1]{%
XXII.4 Hooks for a particular footnote

The \add@hooktoggle@specific@to@cs macro stores to a macro all the current values of hook toggle specific to a command. It is useful for the \Xgroupbyline option, which does not immediately add notes to the inserts list. It uses the \hooktoggle@specific list.

\def\hooktoggle@specific{}
\newcommand{\add@hooktoggle@specific@to@cs}[1]{%
  \def\do##1{%
    \iftoggle{##1@}{%
      \ifcsdef{#1}{%
        \csgappto{#1}{\toggletrue{##1@}}%
      }{%
        \csgdef{#1}{\toggletrue{##1@}}%
      }%
    }{%
      \ifcsdef{#1}{%
        \csgappto{#1}{\togglefalse{##1@}}%
      }{%
        \csgdef{#1}{\togglefalse{##1@}}%
      }%
    }%
  }
  \dolistloop{\hooktoggle@specific}%
%
}

The same, but for optional argument of critical footnotes with assigned value.

\def\hookarg@specific{}
\newcommand{\add@hookarg@specific@to@cs}[1]{%
  \def\do##1{%
    \ifsvoid{##1@}{}{%
      \ifcsdef{#1}{%
        \csxappto{#1}{% \noexpand\csdef{%##1@}{\csname##1@\endcsname}}%
      }{%
        \csxdef{#1}{% \noexpand\csdef{%##1@}{\csname##1@\endcsname}}%
      }%
    }%
  }
  \dolistloop{\hookarg@specific}%
%
}
And now, we define some hooks specific to a note.

\newhooktoggle@specific{fulllines} \newhooktoggle@specific{nonum} \newhooktoggle@specific{nosep} \newhooktoggle@specific{noprefix} \newhooktoggle@specific{prefixmore} \newhookarg@specific{linerangesep}

linerrangesep\@  \linerrangesep\@ is defined by the option linerrangesep of critical notes to change temporarily the line range separator for a specific line. As we have to define it before typesetting the line and undefine it after, we use the family of xkeyval package's key.

\nomk@  \nomk@ toggle is used by reledpar to remove the footnote mark in the text when using \footnoteXmk. Read reledpar handbook.

XXII.5  Alias

\Xnolemmaseparator  \Xnolemmaseparator\[⟨series⟩\] is just an alias for \Xlemmaseparator\[⟨series⟩\].

XXIII  Output routine

Now we begin the output routine and associated things.

XXIII.1  Extra footnotes output

With luck we might only have to change \@makecol and \@reinserts of \LaTeX{}'s kernel. Since reledmac, we use etoolbox's patching commands instead of overriding. It should provides better compatibility with other package which modify these commands.
Extra footnotes output

`\@ddoxtrafeet` is the code extending `\makecol` to cater for the extra `reledmac` feet. We have two categories of extra footnotes. By default, we order the footnote inserts so that the regular footnotes of \LaTeX are first, then familiar familiar footnotes and finally the critical footnotes.

\begin{verbatim}
\newcommand*{\@ddoxtrafeet}{% 
  \IfStrEq{familiar-critical}{\@fnpos}{
  \do@feet\do@Xfeet}% 
  {\setbox\@outputbox \vbox{% 
    \unvbox\@outputbox 
    \do@feet\@custom@order{}{\@fnpos}% 
  }}% 
} \do@feet\@custom@order
\end{verbatim}

`\do@feet\@custom@order` is called when `\@fnpos` is neither `familiar-critical`, nor `critical-familiar`, that is, when the order is more complex. In this case, people must define the order for all footnote series. If they don’t, \LaTeX could perform an infinite run.

\begin{verbatim}
\newcommand{\do@feet\@custom@order}[2]{% 
  \def\do##1{% 
    \edef\@@notesseries{\@firstoftwo##1}% 
    \edef\@@notetype{\@secondoftwo##1}% 
    \ifdefstring{\@@notetype}{critical}{\csuse{#1append@Xnotes}{\@@notesseries}}% 
    \ifdefstring{\@@notetype}{familiar}{\csuse{#1append@notesX}{\@@notesseries}}% 
    }% 
  \expandafter\docsvlist\expandafter{#2}% 
} \do@Xfeet
\end{verbatim}

`\do@Xfeet` is the code extending `\makecol` to cater to the extra critical feet.

\begin{verbatim}
\newcommand*{\do@Xfeet}{% 
  \setbox\@outputbox \vbox{% 
    \unvbox\@outputbox 
    \@opXfeet}}% 
\end{verbatim}
The extra critical feet to be added to the output. A macro which appends critical notes to the output’s routine, also adding vertical space before notes.

\newcommand{\appendXnotes}[1]{%
  \ifvoid\csuse{#1footins}\else%
    \global\skip\csuse{#1footins}=%\csuse{Xbeforenotes@#1}%
    \global\advance\skip\csuse{#1footins} by\csuse{Xafterrule@#1}%
    \printXnotes{#1}%
  \fi%
}%
%
The normal way to add one series, \printXnotes, is replaced by reledpar when using \Pages.

\newcommand{\printXnotes}[1]{%
  \xdef\@currentseries{#1}%
  \csuse{#1footstart}{#1}%
  \csuse{#1footgroup}{#1}%%
}%
%

XXIII.2 Patching standard output’s commands

The \texttt{memoir} class does not use the ‘standard’ versions of \@makecol and \@reinserts, due to its sidebar insert. We had better add that code if \texttt{memoir} is used. (It can be awkward dealing with \texttt{\if} code within \texttt{\if} code, so don’t use \texttt{\ifl@dmemoir} here.)

\@ifclassloaded{memoir}{%\%
\texttt{memoir} is loaded so we use \texttt{memoir}’s built in hooks.
\%\%
\g@addto@macro{\m@mdoextrafeet}{\l@ddoxtrafeet}\%
\g@addto@macro{\m@mdodoreinextrafeet}{\l@ddodoreinxtrafeet}\%
\}%\%
\%
\%

\texttt{memoir} has not been loaded, so patch \@makecol and \@reinserts. If the fancyhdr package \texttt{\<} version 3.8 has been loaded, we patch the \texttt{\latex@makecol} command, because this package redefines the standard \@makecol in the preamble to call \texttt{\latex@makecol}, which has been \texttt{\let} to \@makecol. If this package is not loaded, we directly patch \@makecol. If the fancyhdr package \texttt{\>} version 3.8, we also directly patch \@makecol, because fancyhdr does its own patch \texttt{\AtBeginDocument}.

}\@led@nofoottrue\ifvoid\footins\else\@led@nofootfalse\fi}
\newcommand*{\@led@testifnofoot}{\@led@nofoottrue\ifvoid\footins\else\@led@nofootfalse\fi}

As memoir is not loaded we have patch \doclearpage.

\@led@testifnofoot
\doclearpage: \newcommand*{\@led@testifnofoot}{\@led@nofoottrue\ifvoid\footins\else\@led@nofootfalse\fi}
The `reledpar` package has two options which change the way page numbering works. We need to implement these options on `reledmac` and not on `reledpar` because they have some consequences for the `reledmac` auxiliary files (numbered file; see V.12 p.130). The sameparallelpagenumber option allows the same page number on both left and right side. The prevpagnotnumbered option allows an empty (not numbered) right-side page before `\Pages`.

We cannot implement these two options by changing the value of the `page` counter, since its value is used by many LaTeX features to determine whether a page is left (even numbered) or right (odd numbered). Consequently, we have to do it by patching `\thepage`, in order to use the value of the `par@page` counter instead of the value of the `page` counter.

This counter will be increased in a patched version of LaTeX's `\outputpage` macro, as is the page counter in this macro. However, this increase will take account of the
options.

\par@patch@thepage \par@patch@pagenumbering \par@patch@thepage patches \thepage in order to use the value of \par@page counter and not the value of page. It must be called after any redefinition of \thepage. That is why we insert it at the end of the \LaTeX macro \pagenumbering, which is called by some \xxxmatter commands. In cases when we are using the memoir class, we insert it at the end of \@mempnum. When using \pagenumbering, we also need to reset the \par@page counter. Consequently, we put \par@patch@thepage and counter reset in \par@patch@pagenumbering. We also call \par@patch@thepage at the beginning of the document.

\newcommand{\par@patch@thepage}%
\ifboolexpr{ bool{\sameparallelpagenumber} or bool{prevpgnotnumbered} }{

\{\@led@error@fail@patch@\pagenumbering\}
\fi%
\AtBeginDocument{\par@patch@thepage}%
%\@outputpage

As its name says, \@outputpage is a \LaTeX macro called in the output routine. It is this macro which increases the page counter. We patch it in order to increase, conditionally, the \par@page counter.
You can mark a place in the text using a command of the form \(\text{\textbackslash edlabel}{\langle \text{foo} \rangle}\), and later refer to it using the label \(\langle \text{foo} \rangle\) by typing \(\text{\textbackslash edpageref}{\langle \text{foo} \rangle}\), or \(\text{\textbackslash lineref}{\langle \text{foo} \rangle}\) or \(\text{\textbackslash sublineref}{\langle \text{foo} \rangle}\) or \(\text{\textbackslash pstartref}\). These reference commands will produce, respectively, the page, line sub-line and pstart on which the \(\text{\textbackslash edlabel}{\langle \text{foo} \rangle}\) command occurred.

The reference macros warn you if a reference is made to an undefined label. If \(\langle \text{foo} \rangle\) has been used as a label before, the \(\text{\textbackslash edlabel}{\langle \text{foo} \rangle}\) command will issue a complaint; subsequent \(\text{\textbackslash edpageref}\) and \(\text{\textbackslash lineref}\) commands will refer to the latest occurrence of \(\text{\textbackslash edlabel}{\langle \text{foo} \rangle}\).

Set up a new list, \(\text{\textbackslash labelref0list}\), to hold the page, line and sub-line numbers for each label.

Two convenience macros to zero three / four labeling counters in one go.

\newcommand*{\zz000}{000|000|000} Set three counters to zero in one go
\newcommand*{\zz0000}{000|000|000|000} Set four counters to zero in one go
The \edlabel command first writes a \@lab macro to the \linenum@out file. It then checks to see that the \labelref@list actually has something in it (if not, it creates a dummy entry), and pops the next value for the current label, storing it in \label@refs. Finally it defines the label to be \empty so that any future check will turn up the fact that it has been used.

This version of the original edmac \label uses \@bsphack and \@esphack to eliminate extra space problems and also use the \LaTeX{} write methods for the .aux file.

Jesse Billett found that the original code could be off by several pages. This version, hopefully cures that, and also allows for non-arabic page numbering.

%
Use code from the kernel \label command to write the correct page number. Also define an hypertarget if hyperref package is loaded.

34The remaining macros in this section were kindly revised by Wayne Sullivan, who substantially improved their efficiency and flexibility.

35jdb430@cam.ac.uk via the ctt thread 'ledmac cross referencing', 25 August 2003.
In cases where \texttt{\edlabel} is the first element in a paragraph, we have a problem with line counts, because line counts change only at the first horizontal box of the paragraph. Hence, we need to test \texttt{\edlabel} if it occurs at the start of a paragraph. To do so, we use \texttt{\ifvmode}. If the test is true, we must advance by one unit the amount of text we write into the .aux file. We do so with the \texttt{\advancelabel@refs} command.
The \l@dmake@labels macro gets executed when the labels file is read. For each label it defines a macro, whose name is made up partly from the label you supplied, that contains the page, line and sub-line numbers. But first it checks to see whether the label has already been used (and complains if it has).

The initial use of \newcommand is to catch if \l@dmake@labels has been previously defined (by a class or package).

#1 page number, #2 line number, #3 sub-line number, #4 absolute line number, #5 line number annotation, #6 pstart number, #7 label.

\l@dmake@labels

\ignorespaces

\TeX reads the aux file at both the beginning and end of the document, so we have to switch off duplicate label checking after the first time the file is read.
The `\@lab` command, which appears in the `\linenum@out` file, appends the current value of page, line, sub-line, and absolute line to the `\labelref@list`. These values are defined by the earlier `\@page`, `\@nl`, and the `\sub@on` and `\sub@off` commands appearing in the `\linenum@out` file.

\LaTeX uses the page counter for page numbers. However, it appears that this is not the right place to grab the page number. That task is now done in the `\edlabel` macro. This version of `\@lab` appends just the current line and sub-line numbers to `\labelref@list`.

\UIC{\newcommand*{\@lab}{\ifledRcol \xright@appenditem{\linenumr@p{\line@numR}|\ifsublines@ \sublinenumr@p{\subline@numR}\else 0\fi|\the\absline@numR|\current@annot\to\labelref@listR \else \xright@appenditem{\linenumr@p{\line@num}|\ifsublines@ \sublinenumr@p{\subline@num}\else 0\fi|\the\absline@num|\current@annot\to\labelref@list \fi}\labelref}}}

}

\wrap@edcrossref \wrap@edcrossref is called around all reledmac crossref commands, except those which start with x. It adds the hyperlink.

\newrobustcmd{\wrap@edcrossref}[2]{\%  
 ifdef{\hyperlink}\%  
 {\hyperlink(#1){#2}\%  
 {#2}\%  
}

\edpageref  If the specified label exists, \edpageref gives its page number.

For this reference command, as for the other two, a special version with prefix x is provided for use in places where the command is to be scanned as a number, as in \linewidth. These special versions have two limitations: they do not print error messages if the reference is unknown, and they can’t appear as the first label or reference command in the file; you must ensure that a \edlabel or a normal reference command appears first, or these x-commands will always return zeros.

\LaTeX already defines a \pageref, so changing the name to \edpageref.  

\newcommand*{\edpageref}[1]{\l@dref@undefined{#1}\wrap@edcrossref{#1}{\  
\l@dgetref@num{1}{#1}}}  
\newcommand*{\xpageref}[1]{\l@dgetref@num{1}{#1}}
If the specified label exists, \lineref gives its line number.

If the specified label exists, \sublineref gives its sub-line number.

If the specified label exists, \abselineref gives its absolute line number. This is generally used only by reledmac internal macros.

If the specified label exists, \annotationref gives the line number annotation with which it is associated.
The next three macros are used by the referencing commands above, and do the job of extracting the right numbers from the label macro that contains the page, line, and sub-line number.

\l@dref@undefined The \l@dref@undefined macro is called when you refer to a label with the normal referencing macros. Its argument is a label, and it just checks that the label has been defined.

\l@dgetref@num Next, \l@dgetref@num fetches the number we want. It has two arguments: the first is simply a digit, specifying whether to fetch a page (1), line (2), sub-line (3), (4) start number or (5) side flag. (This switching is done by calling \l@dlabel@parse.) The second argument is the label-macro, which because of the \@lab macro above is defined to be a string of the type 123|456|789.
Notice that we slipped another | delimiter into the penultimate line of \l@dgetref@num, to keep the 'switch-number' separate from the reference numbers. This | is used as another parameter delimiter by \l@dlabel@parse, which extracts the appropriate number from its first argument. The | delimited arguments consist of the expanded label-macro (three reference numbers), followed by the switch-number (1, 2, 3, 4, 5, 6) which defines which of the former seven numbers to extract. (It was given earlier as the first argument of \l@dgetref@num.)

\l@dlabel@parse\newcommand*{\l@dlabel@parse}{\%\def\l@dlabel@parse#1|#2|#3|#4|#5|#6|#7|#8{\%\ifcase #8\%\or #1\%\or #2\%\or #3\%\or #4\%\or #5\%\or #6\%\or #7\%\fi}%\%}

The \xxref command takes two arguments, both of which are labels, e.g., \xxref{mouse}{elephant}. It first does some checking to make sure that the labels do exist (if one does not, those numbers are set to zero). Then it calls \l@inenum and sets the beginning page, line, and sub-line numbers to those of the place where \l@label{mouse} was placed, and the ending numbers to those at \l@label{elephant}. The point of this is to be able to manufacture footnote line references to passages which cannot be specified in the normal way as the first argument to \l@edtext for one reason or another. Using \xxref in the second argument of \l@edtext lets you set things up at least semi-automatically.

\xxref\newcommand*{\xxref}[2]{\%\%\expandafter\ifx\csname the@label#1\endcsname\relax\%\let@tempa\zz@@\%\def\tempc{}\%\else\%\def\tempa{\%\l@getref@num{1}{#1}\%\l@getref@num{2}{#1}\%\l@getref@num{3}{#1}\%}\%\edef\tempc{\%\l@getref@num{5}{#1}\%}\%\fi}%\%\%
\textit{\texttt{\textbackslash appref}}, \textit{\texttt{\textbackslash apprefwithpage}}, \textit{\texttt{\textbackslash SEref}}, \textit{\texttt{\textbackslash SErefwithpage}} and \textit{\texttt{\textbackslash SEonlypage}} print cross-ref to some start / end lines defined by specific commands. It prints the lines as they should be printed in the apparatus (critical notes for not suffixed versions, endnotes for suffixed versions).

Here we define hooks similar to some those related to critical footnotes or endnotes. So, first declare the default value of the hooks for the pseudo-series. Also declare the internal toggle which are switch by \texttt{reledmac}.

Sometimes the `\label` command cannot be used to specify exactly the page and line desired; you can use the `\makelabel` macro to create your own label. For example, if you insert `\makelabel{elephant}{10|25|0}` you will have created a new label, and a later call to `\pageref{elephant}` would print '10' and `\lineref{elephant}` would print '25'. The sub-line number here is zero. `\makelabel` takes a label, followed by a page and a line number(s) as arguments. LaTeX defines a `\makelabel` macro which is used in lists. Peter Wilson has changed the name to `\makelabel`.

\newcommand*{\makelabel}[2]{\expandafter\xdef\csname the@label#1 endcsname{#2}}

(If you are only going to refer to such a label using `\xref`, then you can omit entries in the same way as with `\linenum` (see VI.3 p. 145 and V.9 p. 109), since `\xref` makes a call to `\linenum` in order to do its work.)

### XXV.1 Compatibility with `xref`

Here, we provide compatibility with the `xref` to enable `reledmac`'s cross-referencing to external documents. We assume that the user loads `xref` before `reledmac`, but uses `\externaldocument after loading reledmac`.

`\XR@test` First, we patch the `xr` macro `\XR@test`, which is called on every line of the external `.aux` file, in order to also call macros specific to `reledmac`.

\pretocmd{\XR@test}{\XR@test@mac+++#1#2+++}
The \texttt{\XR@test@mac} takes the full content of a line of the external .aux files, with the three final dots added by \texttt{xr}.

\begin{verbatim}
\long\def\XR@test@mac+++#1+++{\XR@test@mac@test#1}
\end{verbatim}

And finally, \texttt{\XR@test@mac@test} does the job. This code is based on the \texttt{\XR@test} macro of the \texttt{xr} package. However, not that the \texttt{\XR@prefix} is not called here, but it is integrated directly in \texttt{\l@dmake@labels} and \texttt{\l@dmake@labelsR}.

\begin{verbatim}
\long\def\XR@test@mac@test#1#2...{%The triple dots (NOT \ldots) are because of the line 22 of xr.sty v5.02 1994/05/28
\ifx#1\l@dmake@labels%\l@dmake@labels#2%\else\ifx#1\l@dmake@labelsR%\l@dmake@labelsR #2%\else\fi\fi%}
\end{verbatim}

XXVI  Sidenotes

Regular \texttt{\marginpar}s do not work inside numbered text — they do not produce any note but do put an extra unnumbered blank line into the text.

\texttt{\@xympar} Changing \texttt{\@xympar} a little at least ensures that \texttt{\marginpar}s in numbered text do not disturb the flow.

\begin{verbatim}
\pretocmd{\@xympar}{\ifnumberedpar@ \led@warn@NoMarginpars \@esphack \else}\else}%
\apptocmd{\@xympar}{\fi}{\fi}{\fi}{\fi}
\end{verbatim}
We provide sidenotes as replacement for \marginpar in numbered text.

These are the sidenote equivalents to \line@margin and \linenummargin for specifying which margin. The default is the right margin (opposite to the default for line numbers). \l@dgetsidenote@margin returns the number associated to sidenote margin:

left: 0
right: 1
outer: 2
inner: 3
We need two boxes to store sidenote texts.

These specify the width of the left/right boxes (initialised to `\marginparwidth`), their distance from the text (initialised to `\linenumsep`), and the fonts used.

The 'footnotes' for left, right, and moveable sidenotes. The whole scheme is reminiscent of the critical footnotes code.
Put the left/right text into boxes, but just save the moveable text. \l@dosnote, \l@dcsnotetext, \l@dcnoteext@l and \l@dcnotetext@r are etoolbox's lists which will store the content of sidenotes. We store the content in lists, because we need to loop later on them, in case many sidenote co-exist for the same line. That is there some special test to do, in order to:

- Store the content of \ledsidenote to \l@dcnotetext in any cases.
- Store the content of \rightsidenote to:
  - \l@dcnotetext if \ledsidenote is to be put on right.
  - \l@dcnotetext@r if \ledsidenote is to be put on left.
- Store the content of \leftsidenote to:
  - \l@dcnotetext if \ledsidenote is to be put on left.
  - \l@dcnotetext@l if \ledsidenote is to be put on right.

\vl@dlsnote and \vl@dosnote just call \vl@dlsnote or \vl@drsnote, depending of the page.
\setl@dlp@rbox \setl@drpr@box \setl@dlp@rbox\{⟨lednums⟩\}\{⟨tag⟩\}\{⟨text⟩\} puts ⟨text⟩ into the \l@dlp@rbox box. And similarly for the right side box. It is these boxes that finally get displayed in the margins.

\newcommand*{\setl@dlp@rbox}[1]{%

XXVII Minipages and such

We can put footnotes into minipages. The preparatory code has been set up earlier, all that remains is to ensure that it is available inside a minipage box. This requires some alteration to the kernel code, specifically the \@iiiminipage and \endminipage macros. We will arrange this so that additional series can be easily added.

\def\startmini{\@ledgrouptrue\l@dedbeginmini\l@dfambeginmini}
\def\endmini{\IfStrEq{critical-familiar}{\@mpfnpos}{\l@dedendmini\l@dfamendmini}{\IfStrEq{familiar-critical}{\@mpfnpos}{\l@dfamendmini\l@dedendmini}{\do@feet@custom@order{mp@}{\@mpfnpos}}}}
\def\dedbeginmini{\unless\ifnocritical@\def\do##1{\csletcs{v##1footnote}{mpv##1footnote}}\dolistloop{@series}\fi\fi\fi}
\def\dedendmini{\mp@append@Xnotes}

These will be the hooks in \@iiiminipage and \endminipage. They can be extended to handle other things if necessary.

\def\startmini{\@ledgroupfalse\l@dedbeginmini\l@dfambeginmini}
\def\endmini{\IfStrEq{critical-familiar}{\@mpfnpos}{\l@dedendmini\l@dfamendmini}{\IfStrEq{familiar-critical}{\@mpfnpos}{\l@dfamendmini\l@dedendmini}{\do@feet@custom@order{mp@}{\@mpfnpos}}}}
\def\dedbeginmini{\unless\ifnocritical@\def\do##1{\csletcs{v##1footnote}{mpv##1footnote}}\dolistloop{@series}\fi\fi\fi}
\def\dedendmini{\mp@append@Xnotes}

These handle the initiation and closure of critical footnotes in a minipage environment.

XXVIII Indexing

Here is some code for indexing using page and line numbers.

XXVIII.1 Looking on package order

First, ensure that imakeidx or indextools is loaded before eledmac.

\AtBeginDocument{\
unless\if@imakeidx%\
  \@ifpackageloaded{imakeidx}{\led@error@PackageAfterEledmac{imakeidx}}{}%\
  \fi%\
}\unless\if@indextools%\
  \@ifpackageloaded{indextools}{\led@error@PackageAfterEledmac{indextools}}{}%\
  \fi%\
\unless\if@footmisc%\
  \@ifpackageloaded{footmisc}{\led@error@PackageAfterEledmac{footmisc}}{}%\
  \fi%\
%\
}%

XXVIII.2 Auxiliary macros for \edindex

In order to get a correct line number we have to use the label/ref mechanism. These macros are for that.
\newcommand{\pagelinesep}{-}
\newcommand{\edindexlab}{$&$
\newcounter{labidx}
\setcounter{labidx}{0}

\doedindexlabel
This macro sets an \edlabel.
\newcommand{\doedindexlabel}{%
\stepcounter{labidx}%
\edlabel{\edindexlab\thelabidx}%
}\}
\thepageline
This macro makes up the page/line number combo from the label/ref. The associated counter is never directly used, but it is required in order to not have any error message with \edgls.
\newcounter{pageline}%
\renewcommand{\thepageline}{%
\thepage%
\pagelinesep%
\xlineref{\edindexlab\thelabidx}%
}\}
\thestartpageline\theendpageline
These macros make up the page/line start/end number when the \edindex command is called in critical notes.
\newcommand{\thestartpageline}{%
\l@dparsedstartpage%
\pagelinesep%
\l@dparsedstartline%
}\}
\newcommand{\theendpageline}{%
\l@dparsedendpage%
\pagelinesep%
\l@dparsedendline%
}\}
\@edindex@fornote@
This counter is incremented at the beginning of each note (either a footnote or a sidenote), and decremented at the end of each note. If its value is greater than 0, that means we are inside a note.
\newcount\@edindex@fornote
\% 

\prepare@edindex@fornote  This macro is called at the beginning of each critical note. It switches some parameters, to allow index referring to this note, with reference to page and line number. It also defines \@ledinnote@command which will be printed as an encapsulating command after the \.

\newcommand{\prepare@edindex@fornote}{\% \l@dp@rsefootspec#1\% \advance\@edindex@fornote@\@ne\% }\% 
\% 
\get@edindex@ledinnote@command  The \get@edindex@ledinnote@command macro defines a \@ledinnote@command which is added as an attribute (text inserted after \) of the next index entry.

Consequently, we write the definition of the location reference attribute in the .xdy file.

\newcommand{\get@edindex@ledinnote@command}{\% \ifxindy\% \gdef\@ledinnote@command{\% ledinnote\thelabidx% }\% \else\% \immediate\write\eledmac@xindy@out{\% (define-attributes ("ledinnote\thelabidx")~~J \space\space(markup-locref~~J \eledmacmarkuplocrefdepth~~J :open "\string\ledinnote\{\@index@command\}{\%open\ledinnote\{\@index@command\}{\%close\ledinnote\{\@index@command\}{\% :attr "ledinnote\thelabidx"~~J \)\% }\% \% \% \% \else\% \immediate\write\eledmac@xindy@out{\% (define-attributes ("ledinnote\thelabidx")~~J \space\space(markup-locref~~J \eledmacmarkuplocrefdepth~~J :open "\string\ledinnote\{\@index@command\}{\%open\ledinnote\{\@index@command\}{\%close\ledinnote\{\@index@command\}{\% :attr "ledinnote\thelabidx"~~J \)\% }\% \% \% \% \fi\% \% \% 

If we do not use xindy option, \@ledinnote@command will produce something like ledinnote{formattingcommand}. 
XXVIII.4 Analysis of command in indexed text

\get@index@command

This macro is used to analyze if a text to be indexed has a command after a .

\newcommandx{\ledinnote}[3][1,usedefault]{%
  \ifboolexpr{\iffalse}{\ifdefequal{\iftrue}{\ifHy@hyperindex}}% or%
    \bool {xindy@hyperref}%
  }{%
    \csuse{#2}{\hyperlink{#1}{\ledinnotemark{#3}}}%
  }
}%

XXVIII.5 Code for the formatted index

These macros are used to specify that an index reference points to a note. Arguments of \ledinnote are: #1 (optional): the label for the hyperlink, #2: command applied to the number, #3: the number itself.
XXVIII.6 Main code

Eledmac and ledmac were using the specific indexing tools of the memoir in order to allow multiple index. However, eledmac used imakeidx or indextools tools when one of these two package was loaded. This system forced to maintain a double code, which was not very useful. Since reledmac, we use only the imakeidx or indextools tools.

The memoir class provides more flexible indexing than the standard classes. We need different code if the memoir class is being used, except if imakeidx or indextools is used.

\l@noexpands@edgl is a macro to avoid expanding glossaries macros in \textit{\edtext} first argument. It is called by \noexpands. Its definition is made dynamically.

\lnoexpands@edgl%
The original code is principally Wayne Sullivan’s code from edstanza. However, the code has been many time modified by Maïeul Rouquette in order to obtain new features and improved compatibility with reledpar.

### XXX.1 Hanging symbol management

The macro \texttt{\@hangingsymbol} is used to insert a symbol on each hanging of verses. It is set by user level macro \texttt{\sethangingsymbol}. For example, in French typography, the symbol is ‘[’. We obtain it by means of the following code:

\begin{verbatim}
\sethangingsymbol{[}\n\end{verbatim}

The \texttt{\ifinstanza} boolean is used to ensure that we are in a stanza part.

\begin{verbatim}
\newif\ifinstanza
\newcommand{\sethangingsymbol}{\ifinstanza
\def{\@hangingsymbol}{[}\n\else
\\@hangingsymbol{}
\fi}
\end{verbatim}

The boolean \texttt{\ifinserthangingsymbol} is set to TRUE when \texttt{\@lock} is greater than 1, i.e. when we are not in the first line of a verse. The switch of \texttt{\ifinserthangingsymbol} is made in \texttt{\do@line} before the printing of line but after the line number calculation.

\begin{verbatim}
\newif\ifinserthangingsymbol
\newcommand{\inserthangingsymbol}{\ifinserthangingsymbol
\\ifinserthangingsymbol{}
\else
\newcommand{\inserthangingsymbol}{\fi}
\fi}
\end{verbatim}
XXX.2 Using & character

\texttt{\textbackslash \&} Within a stanza the \& macro is going to be usurped. We need an alias in case an \& needs to be typeset in a stanza. Define it rather than letting it in case some other package has already defined it.

\begin{verbatim}
\newcommand*{\ampersand}{\char/\textbackslash \&}
\end{verbatim}

XXX.3 Code category setting

\texttt{\textbackslash \stanza@count} \texttt{\textbackslash \stanzaindentbase} Before we can define the main macros we need to save and reset some category codes. To save the current values we use \texttt{\textbackslash \next} and \texttt{\textbackslash \body} from the \texttt{\loop} macro.

\begin{verbatim}
\chardef\body=\catcode/\textbackslash \@\textbackslash 11
\chardef\next=\catcode/\textbackslash \&\textbackslash \active
\end{verbatim}

XXX.4 Stanza count and indent

A count register is allocated for counting lines in a stanza; also allocated is a dimension register which is used to specify the base value for line indentation; all stanza indentations are multiples of this value. The default value of \texttt{\stanzaindentbase} is 20pt.

\begin{verbatim}
\newcount\stanza@count
\newlength{\stanzaindentbase}
\setlength{\stanzaindentbase}{20pt}
\end{verbatim}

\texttt{\textbackslash \strip@szacnt} \texttt{\textbackslash \setstanzavalues} The indentations of stanza lines are non-negative integer multiples of the unit called \texttt{\stanzaindentbase}. To make it easier for the user to specify these numbers, some list macros are defined. These take numerical values in a list separated by commas and assign the values to special control sequences using \texttt{\mathchardef}. Though this does limit the range from 0 to 32767, it should suffice for most applications, including penalties, which will be discussed below.
In the original edmac, \setstanzavalues{sza}{⟨...⟩} had to be called to set the indents, and similarly \setstanzavalues{szp}{⟨...⟩} to set the penalties. \setstanzaindents and \setstanzapenalties macros are a convenience to give the user one less thing to worry about (misspelling the first argument).

Since version 0.13, the stanzaindentsrepetition counter can be used when the indentation is repeated every n verses. The \managestanza@modulo is a command which modifies the counter stanza@modulo. The command adds 1 to stanza@modulo, but if stanza@modulo is equal to the stanzaindentsrepetition counter, the command restarts it.

The macro \stanzaindent, when called at the beginning of a verse, changes the indentation normally defined for this verse by \setstanzaindent. The starred version skips the current verse for the repetition of stanza indent.
XXX.5  Numbering stanza

Here, macro for numbering stanza. First, the stanza counter.

\thestanza \newcounter{stanza}
\renewcommand{\thestanza}{\textbf{\arabic{stanza}}}
\ifnumberstanza Then, macro to activate automatically numbering of stanza.
\newif{ifnumberstanza}
\@insertstanzanumber Now, macro called at the first line of verse of a stanza.
\newcommand{\@insertstanzanumber}[0]{\ifnumberstanza\ifl@dpairing\ifledRcol\stanzanumwrapper{\thestanzaR}\else\stanzanumwrapper{\thestanzaL}\fi\else\stanzanumwrapper{\thestanza}\fi\setline{1}\fi}
\@advancestanzanumber Also a command to advance the counter of stanza.
\newcommand{\@advancestanzanumber}[0]{\ifnumberstanza\ifl@dpairing\ifledRcol\addtocounter{stanzaR}{1}\else\addtocounter{stanza}{1}\fi\setline{1}\fi}
XXX.6  Stanza number in note

Here, the command called when printing stanza number in notes.

XXX.7  Main work

Now we arrive at the main works. \stanza@line sets the indentation for the line and starts a numbered paragraph—each line is treated as a paragraph. \stanza@hang sets the hanging indentation to be used if the stanza line requires more than one print line.

If it is known that each stanza line will fit on one print line, it is advisable to set the hanging indentation to zero. \sza@penalty places the specified penalty following each stanza line. By default, this facility is turned off so that no penalty is included. However, the user may initiate these penalties to indicate good and bad places in the stanza for page breaking.
Now we have the components of the \stanza macro, which appears at the start of a group of lines. This macro initializes the count and checks to see if hanging indentation and penalties are to be included. Hanging indentation suspends the line count, so that the enumeration is by verse line rather than by print line. If the print line count is desired, invoke \let\startlock\relax and do the same for \endlock. Here and above we have used \xdef to make the stored macros take up a bit less space, but it also makes them more obscure to the reader. Lines of the stanza are delimited by ampersands &. The last line of the stanza must end with \&.

{\gdef\at@every@stanza{#1}}%
}
\def\at@every@stanza{}}%
XXX.8  Restore catcode and penalties

The ampersand & is used to mark the end of each stanza line, except the last, which is marked with \\&. This means that \halign may not be used directly within a stanza line. This does not affect macros involving alignments defined outside \stanza &. Since these macros usurp the control sequence \\&, the replacement \ampersand is defined to be used if this symbol is needed in a stanza. Also we reset the modified category codes and initialize the penalty default.

\catcode\&=\next
\catcode@=\body
\setstanzavalues{szp}{0}
XXXI  Apparatus of Manuscripts

XXXI.1  User level macro

The user level \msdata command only writes the manuscripts data in a numbered auxiliary file. There are two associated etoolbox counters.

\newcommand{\msdata}[1]{\leavevmode\unless\ifstopmsdata@inserted@\stopmsdata\fi\global\stopmsdata@inserted@false\unless\ifledRcol\numgdef{\msdata@c}{\msdata@c+1}\ifdef{\hypertarget}{\edlabel{\msdata@c:start:msdata}}{}\protected@write\linenum@out{}{\string@msd{#1}}\else\numgdef{\msdata@cR}{\msdata@cR+1}\ifdef{\hypertarget}{\edlabel{\msdata@cR:start:msdata}}{}\protected@write\linenum@outR{}{\string@msd{#1}}\fi}}

\def\msdata@c{}\def\msdata@cR{}\newcommand{\stopmsdata}[0]{\leavevmode\unless\ifledRcol\protected@write\linenum@out{}{\string@stopmsd}\ifdef{\hypertarget}{}}

\stopmsdata The user level \stopmsdata command only writes information about the end of manuscripts data in numbered auxiliary file.
XXXI.2 Setting macro

Setting macros for the manuscripts apparatus tools is very easy: they just save their argument in an internal macro.

`\setsdseries`  In which series of notes will be printed the apparatus of manuscripts?

```latex
\newcommand{\setsdseries}[1]{
    \gdef\@msdata@series{#1}
    \def\@msdata@series{A}
}
```

`\setsdposition`  The label for the manuscripts data.

```latex
\def\ms@data@position{msdata-regular}
\newcommand{\setsdposition}[1]{
    \gdef\ms@data@position{#1}
    
}
```

`\setsdlab`  The label for the manuscripts data.

```latex
\def\ms@data@label{Ms.}
\newcommand{\setsdlab}[1]{
    \gdef\ms@data@label{#1}
    
}
```

\ifstopmsdata@inserted@  The \ifstopmsdata@inserted@ boolean is set to TRUE at every \stopmsdata and reset to FALSE at all \msdata. It also set to TRUE at every \beginnumbering. It is used to automatically insert \stopmsdata if forgotten before \msdata.

```latex
\newif\ifstopmsdata@inserted@
\global\stopmsdata@inserted@true
\ifstopmsdata@inserted@
\The boolean is set to TRUE at every \stopmsdata andreset to FALSE at all \msdata. It also set to TRUE at every \beginnumbering. It is used to automatically insert \stopmsdata if forgotten before \msdata.
\else\protected@write\linenum@outR{%\string\@stopmsd%
\ifdef{\hypertarget}{{%\edlabel{\msdata@cR:end:msdata}{}%}
\fi\global\stopmsdata@inserted@true%
}%\fi
```
XXXI.3 Counters and lists

\@msd@c is a counter incremented at each \@msd read in auxiliary file.

\@msd@c is a counter incremented at each \@msd read in auxiliary file.
\numdef{\@msd@c}{0}
\numdef{\@msd@cR}{0}
\%

\add@msd is a counter incremented at each \add@msd data, that is at each time we prepare the insertion of manuscripts data footnote.
\numdef{\add@msd@c}{0}%
\numdef{\add@msd@cR}{0}%
%
\@msdata@list
The \@msdata@list will contain, for each line, the lists of command to be executed to insert the manuscripts apparatus. It will be filled on \add@msdata and looped on \insert@msdata, then emptied.
\def\@msdata@list{}
%

XXXI.4 Auxiliary file macros

\@msd
The \@msd macro is written in the auxiliary file. It just defines three macros by \msdata macro, which allow us to know the manuscripts data, the line number and the absolute line number where it was called.

It also stores the action code 1010 in the list of actions by line.

\newcommand{\msdata}[1]{%
\unless\ifledRcol%
\global\numdef{\@msd@c}{\@msd@c+\@ne}%
\csxglobal{\msdata@\@msd@c data}{#1}%
\csxglobal{\msdata@\@msd@c linenumber}{\the\line@num}%
\csxglobal{\msdata@\@msd@c abslinenumber}{\the\absline@num}%
\xright@appenditem{\the\absline@num}	o\actionlines@list%
\xright@appenditem{-1010}	o\actions@list%
\else%
\global\numdef{\@msd@cR}{\@msd@cR+\@ne}%
\csxglobal{\msdata@\@msd@cR dataR}{#1}%
\csxglobal{\msdata@\@msd@cR linenumberR}{\the\line@numR}%
\csxglobal{\msdata@\@msd@cR abslinenumberR}{\the\absline@numR}%
\xright@appenditem{\the\absline@numR}	o\actionlines@listR%
\xright@appenditem{-1010}	o\actions@listR%
\fi%
}%
%
\@stopmsd
Inserted in the auxiliary file by \@stopmsd, the \@stopmsd macro will store in two commands the line number and the absolute line number on which it is called.
XXXI.5  Action macro

\add@msdata is executed on each line when action code 1010 is seen. It will not insert immediately the manuscript data footnote, as action code are executed before the line be typeset, and, consequently, could be on the previous page. So it just stores the manuscript data footnote to \@msdata@list.

\newcommand{\add@msdata}{%
XXXI  Apparatus of Manuscripts

\egroup%
\insertfrompreviouspage
The \if@msdata@insertedfrompreviouspage boolean is set to TRUE if reledmac automatically inserts data from previous page in the first line of a page.
\newif\if@msdata@insertedfrompreviouspage
\if@msdata@insertedfrompreviouspage%
\add@msdata@firstlineofpage is called at the first line of every page. It inserts manuscript data which start on one of the previous pages and continue on this page.

\newcommand{\add@msdata@firstlineofpage}{%
XXXI.6 Inserting footnote

Just before inserting standard insert (familiar and critical footnotes, sidenotes), we call \insert@msdata to insert manuscripts data’s footnotes.

\insert@msdata

XXXI.7 Other

\reset@msd@options@iffullpage sets some options if the manuscripts data are for all the page. \reset@msd@options@iffullpage resets them after the footnote. \if@msd@options@fullpage is switch to true in add@msdata@firstlineofpage if these option must be inserted.
XXXII  Arrays and tables

XXXII.1  Preamble: macro as environment

The following is borrowed, and renamed, from the amsmath package. See also the CTT thread ’eq and amstex’, 1995/08/31, started by Keith Reckdahl and ended definitively by David M. Jones.

Several of the [math] macros scan their body twice. This means we must collect all text in the body of an environment form before calling the macro.

\@emptytoks  This is actually defined in the amsgen package.
\newtoks\@emptytoks
\%  The rest is from amsmath.

\@denvbody  A token register to contain the body.
\newtoks\@denvbody
\%  \addtol@denvbody\ addtol@denvbody{arg} adds arg to the token register \@denvbody.
\newcommand{\addtol@denvbody}{\%  \global\@denvbody\expandafter{\the\@denvbody\#1}}
\%  \@dcollect@body  The macro \@dcollect@body starts the scan for the \end{⟨env⟩} command of the current environment. It takes a macro name as argument. This macro is supposed to take the whole body of the environment as its argument. For example, given cenv#1{...} as a macro that processes #1, then the environment form, \begin{env} would call \@dcollect@body\cenv.
\newcommand{\l@dcollect@body}{% 
\l@denvbody{{\expandafter#1\expandafter{\the\l@denvbody}}}% 
\edef\processl@denvbody{\the\l@denvbody\noexpand\end{% 
\l@dbegin@stack{b}% 
\begingroup 
\expandafter\let\csname\@currenvir\endcsname\l@dcollect@@body 
\edef\processl@denvbody{\expandafter\noexpand\csname\@currenvir\endcsname} 
\processl@denvbody % A little tricky! Note the grouping 
}}% 
\l@dpush@begins 
\l@dcollect@@body 
\l@dcollect@@body 
\l@dcollect@body takes two arguments: the first will consist of all text up to the next \end command, and the second will be the \end command’s argument. If there are any extra \begin commands in the body text, a marker is pushed onto a stack by the \l@dpush@begins function. Empty state for this stack means we have reached the \end that matches our original \begin. Otherwise we need to include the \end and its argument in the material we are adding to the environment body accumulator.

\l@dpush@begins 
\l@dpush@begins takes a piece of the current environment’s contents to \l@denvbody, we scan it to check for additional \begin tokens, and add a ‘b’ to the stack for any that we find.

There was a question on CTT about how to use \collect@body for a macro taking an argument. The following is part of that thread.

From: Heiko Oberdiek <oberdiek@uni-freiburg.de>
Newsgroups: comp.text.tex
Subject: Re: Using \collect@body with commands that take >1 argument
eed132@psu.edu (Evan) wrote:

I’m trying to make a new LaTeX environment that acts like the \colorbox command that is part of the color package. I looked through the FAQ and ran across this bit about using the \collect@body command that is part of AMSLaTeX:

http://www.tex.ac.uk/cgi-bin/texfaq2html?label=cmdasenv

It almost works. If I do something like the following:

\newcommand{\redbox}[1]{\colorbox{red}{#1}}

\makeatletter
\newenvironment{coloredbox}{\collect@body \redbox}{}
\makeatletter
\newenvironment{coloredboxII}{\collect@body \redbox}{% ignore spaces at begin and end of environment
\newenvironment{mycoloredboxII}[1]{% ignore spaces at begin and end of environment
\def\next@{\mycoloredboxII[#1]}%}
\newcommand{\mycoloredboxII}[2]{% support of optional color model argument
  \colorbox{#1}{\ignorespaces#2\unskip}
\newcommand\coloredboxIII\endcsname{}
def\coloredboxIII#1{%\@coloredboxIII(#1)%
}\def\@coloredboxIII#1#{%\def\next@{\mycoloredboxIII(#1){#2}%\collect@body\next@
}\newcommand{\mycoloredboxIII}[3]{%\colorbox#1{#2}{\ignorespaces#3\unskip}%\makeatother
\begin{document}
Black text before \begin{coloredbox}{blue}
Hello World \end{coloredbox}
Black text after

Black text before \begin{coloredboxII}{blue}
Hello World \end{coloredboxII}
Black text after

Black text before \begin{coloredboxIII}[rgb]{0,0,1}
Hello World \end{coloredboxIII}
Black text after
\end{document}

Yours sincerely
Heiko <oberdiek@uni-freiburg.de>

XXXII.2 Tabular environments

This is based on the work by Herbert Breger in developing tabmac.tex.
The original tabmac.tex file was void of comments or any explanatory text other
than the above notice. The algorithm is Breger’s. Peter Wilson have made some cosmetic
changes to the original code and reimplemented some things so they are more LaTeX-
like. All the commentary are from Peter Wilson, as are any mistake or errors.
However, Maïeul Rouquette has modified code in order to add new features of
eledmac and reledmac.
### Tabular environments

#### XXXII.2 Tabular environments

#### XXXII.2.1 Disabling and restoring commands

**\@dtabnoexpands**

More no expansion for critical and familiar footnotes in tabular environment.

```latex
\newcommand*{\@dtabnoexpands}{% 
\let\rtab=0% 
\let\ctab=0% 
\let\ltab=0% 
\let\rtabtext=0% 
\let\ctabtext=0% 
\let\ltabtext=0% 
\let\edbeforetab=0% 
\let\edaftertab=0% 
\let\edatleft=0% 
\let\edatright=0% 
\let\edvertdots=0% 
\let\edrowfill=0% 
} 

\disable@familiarnotes\restore@familiarnotes

Macros to disable and restore familiar notes, to prevent them from printing multiple times in edtabularx and edarrayx environments.

```latex
\newcommand{\disable@familiarnotes}{% 
\unless\ifnofamiliar@% 
  \def\do##1{% 
    \csletcs{footnote##1}{footnote@@##1}% 
    \expandafter{\renewcommand \csname footnote##1\endcsname[1]{% 
      \protected@csxdef{@thefnmark##1}{\csuse{thefootnote##1}}% 
      \csuse{@footnotemark##1}%= 
    }% 
  }% 
  \dolistloop{\@series}%= 
}%= 
\newcommand{\restore@familiarnotes}{% 
\unless\ifnofamiliar@% 
  \def\do##1{\csletcs{footnote##1}{footnote@@##1}%= 
  \dolistloop{\@series}%= 
}%= 
\fi% 
}%= 

\disable@sidenotes\restore@sidenotes

The same for sidenotes.
\newcommand{\disable@sidenotes}{% 
\let\@@ledrightnote\ledrightnote%
\let\@@ledleftnote\ledleftnote%
\let\@@ledsidenote\ledsidenote%
\let\ledrightnote\@gobble%
\let\ledleftnote\@gobble%
\let\ledsidenote\@gobble%
}%
\newcommand{\restore@sidenotes}{% 
\let\ledrightnote\@@ledrightnote%
\let\ledleftnote\@@ledleftnote%
\let\ledsidenote\@@ledsidenote%
}%
%
\disable@endnotes
\restore@endnotes

The same for endnotes.

\newcommand{\disable@endnotes}{% 
\unless\ifnoend@
  \def\do##1{% 
    \csletcs{##1@@endnote}{##1endnote}% 
    \expandafter\renewcommand \csname ##1endnote\endcsname[1]{}% 
  }% 
  \dolistloop{\@series}%
  \fi%

XXXIV  Section’s title commands

XXXIV.1  Commands to disable some feature

\ledsectnotoc  The \ledsectnotoc only disables the \addcontentsline macro.
\newcommand{\ledsectnotoc}{\let\addcontentsline@gobblethree}

\ledsectnomark  The \ledsectnomark only disables the \chaptermark, \sectionmark and \subsectionmark macros.
\newcommand{\ledsectnomark}{\let\chaptermark@gobble\let\sectionmark@gobble\let\subsectionmark@gobble}

XXXIV.2  General overview

The system of \eledxxxx commands to section text work like this:

1. When one of these commands is called, \reledmac writes to an auxiliary files:
   - The section level.
   - The section title.
   - The side (when \reledpar is used).
   - The pstart where the command is called.
   - If we have starred version or not.

2. \reledmac adds the title of the section to pstart, as normal content. This is to enable critical notes.
3. When \LaTeX{} is run a other time, this file is read. That:

- Adds the pstart number to a list of pstarts where a sectioning command is used.
- Defines a command, the name of which contains the pstart number, and which calls the normal \LaTeX{} sectioning command.

4. This last command is called when the pstart is effectively printed.

XXXIV.3 \beforeeledchapter command

We do not define commands for \eledsection{} and related if the noeledsec option is loaded. We use etoolbox tests and not the \ifxxx...\else...\fi structure to prevent problem of expansions with command after the \ifxxx which contains \fi. As we patch command inside this test, we need to change the category code of # character before \notbool{} statement, because the second argument is read with the standard catcode (read The TeXbook to understand when the catcode’s change has effect).

\begin{verbatim}
\catcode`\#=12
\notbool{@noeled@sec}{%

\beforeeledchapter

For technical reasons, not yet solved, page-breaking before chapters can’t be made automatically by eledmac. Users have to use \beforeeledchapter.

\begin{verbatim}
\if@dmemoir
  \newcommand\beforeeledchapter{%
  \clearforchapter%
  }
\else
  \newcommand\beforeeledchapter{%
  \if@openright%
  \cleardoublepage%
  \else%
  \clearpage%
  \fi%
  }
\fi%
\end{verbatim}

XXXIV.4 Auxiliary commands

\print@leftmargin@eledsection and \print@rightmargin@eledsection are added by releledmac inside the code of sectioning command, in order to affix lines numbers. They include tests for RTL languages.

\begin{verbatim}
\def\print@rightmargin@eledsection{%
  \if@eled@sectioning%
  \begingroup%
  %
  \end{verbatim}
XXXIV.5 Patching standard commands

We have to patch \LaTeX, book and memoir sectioning commands in order to:

- Disable \edtext inside.
- Disable page breaking (for \chapter).
- Add line numbers and sidenotes.

Unfortunately, Maïeul Rouquette was not able to try if memoir is loaded. That is why elemac tries to define for both standard class and memoir class.

Close the \notbool{@noeled@sec} statement. Also, we have finished patching the
commands, using # with a catcode equal to 12, so we are restoring the normal catcode
for #.

\protect\catcode`\#/=6 %Space NEEDS by \catcode
%

\chapter

We patch the \chapter command even if the noeledsec option is called, because we
can use \chapter in the optional argument of a \pstart in parallel typesetting.
XXXIV Section's title commands

The boolean \if@eled@sectioning is set true when a sectioning command is called by a \eledxxx command, and set to false after. It is used to enable/disable line number printing.

We reopen a new \notbool{@noeled@sec} statement, as we will define the \elesection commands.

XXXIV.6 Main code of \eledxxx commands

\eled@sectioning@out is the output file, to dump the pstarts where a sectioning command is used.

And now, the user sectioning commands, which write to the file, and also add content as a "normal" line.

\end{verbatim}

End of the conditional test about noeledsec option.

XXXV Page breaking or no page breaking depending of specific lines

By default, page breaks are automatic. However, the user can define lines which will force page breaks, or prevent page breaks around one specific line. On the first run, the line-list file records the line number of where the page break is being changed (either forced, or prevented). On the next run, page breaks occur either before or after this line, depending on how the user sets the command. The default setting is after the line.

\normal\text@break

\normal\text@break is an etoolbox list which contains the absolute line number of the last line, for each page.

\def\normal@page@break{}

\%\

The \l@prev@pb macro is a etoolbox list, which contains the lines in which page breaks occur (before or after). The \l@prev@nopb macro is a etoolbox list, which contains the lines with NO page break before or after.

\def\l@prev@pb{}
\def\l@prev@nopb{}
\%
The \texttt{\led@pb} macro writes the call to \texttt{\led@pb} in line-list file. The \texttt{\led@pbnum} macro writes the call to \texttt{\led@pbnum} in line-list file. The \texttt{\led@nopb} macro writes the call to \texttt{\led@nopb} in line-list file. The \texttt{\led@nopbnum} macro writes the call to \texttt{\led@nopbnum} in line-list file.

\begin{verbatim}
10067 \newcommand{\led@pb}{\write\linenum@out{\string\led@pb}}
10068 \newcommand{\led@pbnum}[1]{\write\linenum@out{\string\led@pbnum{#1}}}
10069 \newcommand{\led@nopb}{\write\linenum@out{\string\led@nopb}}
10070 \newcommand{\led@nopbnum}[1]{\write\linenum@out{\string\led@nopbnum{#1}}}
\end{verbatim}

The \texttt{\led@pb} adds the absolute line number in the \texttt{\prev@pb} list. The \texttt{\led@pbnum} adds the argument in the \texttt{\prev@pb} list. The \texttt{\led@nopb} adds the absolute line number in the \texttt{\prev@nopb} list. The \texttt{\led@nopbnum} adds the argument in the \texttt{\prev@nopb} list.

\begin{verbatim}
10072 \newcommand{\led@pb}{\listxadd{\l@prev@pb}{\the\absline@num}}
10073 \newcommand{\led@pbnum}[1]{\listxadd{\l@prev@pb}{#1}}
10074 \newcommand{\led@nopb}{\listxadd{\l@prev@nopb}{\the\absline@num}}
10075 \newcommand{\led@nopbnum}[1]{\listxadd{\l@prev@nopb}{#1}}
\end{verbatim}

The \texttt{\led@pbsetting} macro only changes the value of \texttt{\led@pb@macro}, for which the default value is before.

\begin{verbatim}
10077 \def\led@pb@setting{before}
10078 \newcommand{\led@pbsetting}[1]{\gdef\led@pb@setting{#1}}
\end{verbatim}

The \texttt{\led@check@pb} and \texttt{\led@check@nopb} are called before or after each line. They check if a page break must occur, depending on the current line and on the content of \texttt{\@pb}.

\begin{verbatim}
10080 \newcommand{\led@check@pb}{\xifinlist{\the\absline@num}{\l@prev@pb}{\pagebreak[4]}}
10081 \newcommand{\led@check@nopb}{%}
10082 \IfStrEq{\led@pb@setting}{before}{%}
10083 \xifinlist{\the\absline@num}{\l@prev@nopb}{%}

10089 \{\}%%
10090 \IfStrEq{\led@pb@setting}{after}{%}
10091 \xifinlist{\the\absline@num}{\l@prev@nopb}{%}
10092 \xifinlist{\the\absline@num}{\normal@page@break}{%}
10093 \{\nopagebreak[4]\enlargethispage{\baselineskip}\}%%
10094 \{\}%%
10095 \{\}%%
10096 \}%%
\end{verbatim}
XXXVI  Long verse: prevents being separated by a page break

\iflednopbinverse  The \lednopbinverse boolean is set to false by default. If set to true, reledmac will automatically prevent page breaks inside verse. The declaration is made at the beginning of the file, because it is used as a package option.

\check@pb@in@verse  The \check@pb@in@verse checks if a verse is broken in two page. If true, it adds:

- The absolute line number of the first line of the verse -1 in the \led@pb list, if the page break must occur before the verse.
- The absolute line number of the first line of the verse -1 in the \led@nopb list, if the page break must occur after the verse.

XXXVII  Tools for hyperref package

\Hy@Raisedlink@left  The hyperref package provides a \Hy@raisedlink command, to be used to add an anchor to the top of a line and not to the bottom of it\footnote{http://tex.stackexchange.com/a/17138/7712}.
However, this command disrupts the line breaking mechanism when it is called before any word. This is why \eledmac defines \Hy@raisedlink@left that is called to the left of words, at the beginning of \edtext or inside the \edlabel commands.\footnote{The code is inspired by an answer given by @unbonpetit. Thanks to him. \url{http://texnique.fr:80/osqa/questions/781/hyraisedlink-perturbe-la-maniere-dont-se-fait-la-coupure-de-ligne/801}}

However, this command disrupts the line breaking mechanism when it is called before any word. This is why \eledmac defines \Hy@raisedlink@left that is called to the left of words, at the beginning of \edtext or inside the \edlabel commands.\footnote{The code is inspired by an answer given by @unbonpetit. Thanks to him. \url{http://texnique.fr:80/osqa/questions/781/hyraisedlink-perturbe-la-maniere-dont-se-fait-la-coupure-de-ligne/801}}

Here, we define some commands for the \eledmac-compat option.

\newcommand{\footnormalX}{\arrangementX{normal}}\%\newcommand{\footparagraphX}{\arrangementX{paragraph}}\%\newcommand{\foottwocolX}{\arrangementX{twocol}}\%\newcommand{\footthreecolX}{\arrangementX{threecol}}\%\unless\ifnocritical\newcommand{\footnormal}{\arrangement{normal}}\%\newcommand{\footparagraph}{\arrangement{paragraph}}\%\newcommand{\foottwocol}{\arrangement{twocol}}\%\newcommand{\footthreecol}{\arrangement{threecol}}\%\let\hsizetwocol\Xhsizetwocol\let\hsizethreecol\Xhsizethreecol\let\bhookXnote\Xbhooknote

Appendix A  Things to do when changing versions

A.1 Migrating from edmac to ledmac

If you have never used edmac, ignore this section. If you have used edmac and are starting on a completely new document, ignore this section. Only read this section if you are converting an original edmac document to use ledmac.

The package still provides the original \text command, but it is (a) deprecated, and (b) its name has been changed\footnote{A name like \text is likely to be defined by other \LaTeX packages (it certainly is by the AMS packages) and it seems sensible to try and avoid clashes with other definitions.} to \critext; use the \edtext macro instead. However, if you do use \critext (the new name for \text), the following is a reminder.

\critext

Within numbered paragraphs, footnotes and endnotes are generated by forms of the \critext macro:

\critext{⟨lemma⟩}{⟨commands⟩}/

The ⟨lemma⟩ argument is the lemma in the main text: \critext both prints this as part of the text, and makes it available to the ⟨commands⟩ you specify to generate notes. The / at the end terminates the command; it is part of the macro’s definition so that spaces after the macro will be treated as significant.

For example:

I saw my friend \critext{Smith} \footnote{Jones C, D.} on Tuesday.

The lemma Smith is printed as part of this sentence in the text, and is also made available to the footnote that specifies a variant, Jones C, D. The footnote macro is supplied with the line number at which the lemma appears in the main text.

The ⟨lemma⟩ may contain further \critext commands. Nesting makes it possible to print an explanatory note on a long passage together with notes on variants for individual words within the passage. For example:

\critext{I saw my friend \critext{Smith}}{\footnote{Jones C, D.} on Tuesday.}

\footnote{The date was July 16, 1954.}

However, \critext cannot handle overlapping but unnested notes—for example, one note covering lines 10–15, and another covering 12–18; a \critext that starts in the ⟨lemma⟩ argument of another \critext must end there, too. (The ⟨lemma⟩ and ⟨linenum⟩ commands may be used to generate overlapping notes if necessary.)

The second argument of the \critext macro, ⟨commands⟩, is the same as the second argument to the \edtext macro.

It is possible to define aliases for \critext, which can be easier to type. You can make a single character substitute for \critext by saying this:

\catcode'\equal\active

\footnote{A name like \text is likely to be defined by other \LaTeX packages (it certainly is by the AMS packages) and it seems sensible to try and avoid clashes with other definitions.}
Then you might say `<{Smith}\variant{Jones}>`. This of course destroys the ability to use `<` in any new macro definitions, so long as it remains in effect; hence it should be used with care.

Changing the character at the end of the command requires more work:

\[
\text{catcode'}=\text{active}
\]
\[
def\text{xtex#1#2}{\text{critext}{#1}{#2}/}
\]
\[
\text{let}=\text{xtex}
\]

This allows you to say `<{Smith}\Afootnote{Jones}>`.

Aliases for `\critext` of the first kind shown here also can’t be nested—that is, you can’t use the alias in the text that forms the first argument to `\critext`. (See VI p. 136 to find out why.) Aliases of the second kind may be nested without any problem.

If you really have to use `\critext` in any of the tabular or array environments, then `\edtext` must not be used in the same environment. If you use `\critext` in one of these environments then you have to issue the declaration `\usingcritext` beforehand. The declaration `\usingedtext` must be issued to revert to the default assumption that `\edtext` will be used.

### A.2 Migration from ledmac to eledmac

In eledmac, some changes were made in the code to allow easy customization. This may cause problems for people who have already made their own. The next sections explain how to handle this.

If you have created your own series using `\addfootins` and `\addfootinsX`, you must use instead the `\newseries` command (see 6.7.1 p. 41), and remove any `\Xfootnote` command.

If you have customized the `\XXXXXXfmt` command, please check whether you can achieve the same by the commands documented for display options (7 p. 43) or `\Xfootnote` options (6.2.2 p. 30). Otherwise please add a new ticket on Github to request a new function for doing this.

If for some reason you do not want to make the modifications to use the new functions of eledmac, you can continue using your own `\XXXXXXfmt` command, but you must replace:

\[
\renewcommand*{XXXXfmt}[3]
\]

with

\[
\renewcommandx*{XXXXfmt}[4][4=Z]
\]

---

A.3  Migration to eledmac 1.5.1

If you do not make that, you will get a spurious \[X\], where X is series letter.
If you used a \protect command inside a \footnote command inside a numbered
section, you must change the \protect to \noexpand. Otherwise the command after
the \protect will be discarded.

A.3  Migration to eledmac 1.5.1

The version 1.5.1 corrects a bug in stanzaindentsrepetition (cf. 9.3 p. 58). This bug
had two consequences:

1. stanzaindentsrepetition did not work when its value was greater than 2.
2. stanzaindentsrepetition worked wrong when its value was equal to 2.

So, if you used stanzaindentsrepetition with a value equal to 2, you had to
change your \setstanzaindents. Explanation:
\setcounter{stanzaindentsrepetition}{2}
\setstanzaindents{5,1,0}

This code, in versions prior to 1.5.1, made the first line have an indentation of 0, the
second line of 1, the third verse of 0, the fourth verse of 1 and so forth.
But this code should have instead achieved quite the contrary: the first line would
have an indentation of 1, the second line of 0, the third line of 1, the fourth line of 0 an
so forth.
So version 1.5.1 corrected this bug. If you want to keep the former presentation, you
must change:
\setcounter{stanzaindentsrepetition}{2}
\setstanzaindents{5,1,0}
to:
\setcounter{stanzaindentsrepetition}{2}
\setstanzaindents{5,0,1}

A.4  Migration to eledmac 1.12.0

The migration to eledmac 1.12.0 is easy:

• You must first delete all the auxiliary files, then compile your document three
times as usual.
• If you have modified \@lreg, which is not advisable, you must rename it to
\@nlreg.

There is an additional problem. If you have put text into brackets just after \pstart
or \pend, this text will be considered to be an optional argument of \pstart or \pend
(see 5.2.3 p. 19). If so, add a \relax between \pstart/\pend and the first bracket.
The version 1.12.0 also introduce a better way to handle sectional divisions inside
numbered text. Please read 16.2 p. 75
Appendix A  Things to do when changing versions

A.5 Migration to eledmac 17.1

This version changes the default setting of \Xpstart. Henceforth, pstart numbers will be printed in footnotes within the section of text where you have called \numberpstarttrue.

We do not see any reason to print them in the other sections. However, if you want to print the \pstart numbers in every footnote, whatever the section, without having to use \numberpstarttrue, you can use \Xpstarteverytime.

A.6 Migration to eledmac 1.21.0

A.6.1 \Xledsetnormalparstuff and \ledsetnormalparstuffX

The \ledsetnormalparstuff has been split into two different commands:

- \Xledsetnormalparstuff for critical notes;
- \ledsetnormalparstuffX for familiar notes.

Both commands can take an optional argument which is the series letter. If you have redefined \ledsetnormalparstuff or any of the commands which call them, you must change them accordingly.

A.6.2 Endnotes

In any case, delete the .end file before the next run.

The previous version of Eledmac had a bug: there were two spaces between the starting page number and the starting line number, but only one space between the ending page number and the ending line number.

As a matter of fact, a spurious space was added after the first \printnpnum. This spurious space has been deleted. However, if you want to keep the previous spurious space, you may load the package with the oldprintnpnumspace option.

If you have redefined \endprint, you must:

- Contact us and ask for the feature that required your hack, in order to avoid such a hack in the future.
- Use the new fifth argument.
- Add \xdef\@currentseries{#4} at the beginning of your own command.

A.7 Migration to eledmac 1.22.0

The \ledinnote command now takes a first optional argument, which is the label for the hyperreference. If you have redefined it, change your redefinition, and check whether you can avoid this redefinition by only redefining \ledinnotemark.

A.8 Migration to eledmac 1.23.0

You must delete the numbered auxiliary files before compiling with the new version of eledmac.
A.9 Migration from eledmac to reledmac

There are many changes in reledmac which require the user to make modifications.

A.9.1 Risk of ‘no room for a new’

The risk to obtain a ‘no room for a new something’ error is greater in reledmac than it is in eledmac. See [19.1.3 p. 78] in order to know how to limit it.

A.9.2 Multiple indices with memoir

Eledmac and ledmac used the specific indexing tools of the memoir class designed to produce multiple indices. However, eledmac could also use imakeidx or indextools tools independently of the memoir class. This system forced to maintain redundant code. Since reledmac, we use only the imakeidx or indextools tools.

Consequently: Users of memoirare invited to use indextool or imakeidx to produce multiple indices.

A.9.3 Deprecated commands and options

The table of deprecated commands and their alternatives follows. Note that the way some commands must be used may have changed. Please read the handbook.

<table>
<thead>
<tr>
<th>Deprecated command</th>
<th>Replaced with</th>
</tr>
</thead>
<tbody>
<tr>
<td>\addfootins</td>
<td>\newseries</td>
</tr>
<tr>
<td>\addfootinsX</td>
<td>\newseries</td>

<td>Package option noeledsec</td>
</tr>
<tr>
<td>\noendnotes</td>
<td>Package option noendnotes</td>
</tr>
<tr>
<td>\pageparbreak</td>
<td>\ledpb</td>
</tr>
</tbody>
</table>

The ledsecolinenumber option has been removed, because it was related to deprecated commands.

The oldprintnpnumspace option has been removed too, because it was related to a historical bug. The \usingedtext and \usingcritext commands are also deprecated.
### A.9.4 \texttt{\textbackslash renewcommand} replaced by command

Many uses of \texttt{\textbackslash renewcommand} have been replaced with uses of specific commands. Please read handbook about specific commands.

<table>
<thead>
<tr>
<th>Deprecated \texttt{\textbackslash renewcommand}</th>
<th>Replaced with</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{@led\textbackslash extranofeet}</td>
<td>\texttt{\textbackslash newseries}</td>

<td>\texttt{\textbackslash symplinenum}</td>
<td>\texttt{\textbackslash Xsymlinenum}</td>
</tr>
</tbody>
</table>

### A.9.5 Commands the names of which have been changed

In order to help the migration from \texttt{eledmac} to \texttt{reledmac}, you may load \texttt{reledmac} with \texttt{eledmac-compat} option. However, it is advised not to, and to change the command names themselves instead. In many cases, you use only a few of them, except the \texttt{\textbackslash footparagraph} command.

<table>
<thead>
<tr>
<th>Old command</th>
<th>New command</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{\textbackslash footparagraph}</td>
<td>\texttt{\textbackslash Xarrangement}</td>
</tr>
<tr>

Appendix A  Things to do when changing versions

A.9.6  Endnotes

With reledmac, there is now one auxiliary file for each endnotes set (.Aend, .Bend, .Cend etc.). If you have overridden \doendnotes (which you should not have done) you must adapt your code.

A.9.7  Z Series

The ‘Z’ series of notes has been removed. Only five series are provided now by default: A, B, C, D, E.

A.9.8  Internal commands

Users who have overriden internal commands, which is wrong, must adapt according to the following. Or better, they should not override any of such commands and use reledmac options instead.

• If you have modified \Xfootfmt, note that the fourth argument is now mandatory.

• \unvxh has been replaced with \Xunvxh and \unvxhX with two mandatory arguments.

A.10  Migration to reledmac 2.1.0

Reledmac 2.1.0 fix some bugs when using \Xbhooknote and \bhooknoteX not in order to execute code at the beginning of each notes, but to insert content at the beginning of each notes.

People who use these commands to do it, which is not the original idea, must change the following:

1. Horizontal space is no longer automatically added after the content of the \Xbhooknote/\bhooknoteX argument. You must include it manually. So instead of \Xbhooknote{content}, use \Xbhooknote{content }.

2. Indent is no longer automatically added before the content of the \Xbhooknote/\bhooknoteX argument. If you want to keep it, add \indent to the argument of \Xbhooknote/\bhooknoteX.

A.11  Migration to reledmac 2.1.3

Reledmac 2.1.3 fix an historical bug, (style in ledmac 0.7!) which doubled the space before the rules of paragraphed familiar footnotes. Consequently, if you use paragraphed familiar footnotes, you should maybe adapt it, playing with \beforenotesX.

A.12  Migration to reledmac 2.3.0

Before reledmac 2.3.0, for typesetting verse, any empty line was considered a paragraph inside verses. Counting empty lines this created breaking verse, hanging verses, and also added spurious vertical spaces. Version 2.3.0 disables paragraph in stanza. If you want vertical space, use the optional argument of \stanza or \endverse.
A.13 Migration to reledmac 2.4.0

It is not mandatory, but strongly recommended, to change any \renewcommand{\endashchar}{(...) to the use of \Xlinerangeseparator or / and \Xendlinerangeseparator (7.2.5 p. 46).

A.14 Migration to reledmac 2.5.0

It is strongly recommended to stop redefining \printnpnum and to use the hooks documented in 7.2.4 p. 46.

\xlineref does not print anymore the side flag (R for right side), because it is incompatible with numerical test. Use \xflagref to obtain it.

The \printlines and \printendlines commands take now an eighth argument, which is the side flag. It is strongly recommended to NEVER redefine these two commands and to use the setting commands instead (or to ask for new setting commands if the actual does not answer to your needs). However, if you have done it, just change your redefinition to have a new argument.

It is strongly recommended to stop redefining \fullstop and to use \Xsublinesep instead.

A.15 Migration to reledmac 2.7.0

\SErefonlypage (introduced in reledmac 2.5.0) added an parenthesis after the page number. This was just an error, linked to a bad imitation of \SErefwithpage. That has been deleted. And so, the \XendafterpagenumberSErefonlypage to set it was also deleted.

\rigidbalance is split to two new commands: \Xrigidbalance for critical footnotes and \rigidbalanceX for familiar footnotes. If you have redefined it — but why should you have ?—, you should split your single redefinition in two redefinitions.

A.16 Migration to reledmac 2.7.2

\Xhsize is already defined in the floatrow package. It becomes \Xwidth, and, consequently, \hsizex becomes \widthx.

The ancient names are temporarily maintained as aliases.

A.17 Migration to reledmac 2.8.0

Reledmac 2.8.0 fix spurious indents for paragraphed critical and familiar footnotes in ledgroup and minipage. You can re-establish the indent with \Xparindent and \parindentx.

A.18 Migration to reledmac 2.13.1

Reledmac 2.5.0 added a bug, which makes the right flag to be printed on the right side of critical footnotes, even if not explicitly requested by using \Xlineflag.
Version 2.13.1 solves this issue. Please use `\lineflag` if you want to add the right flag.

**A.19 Migration to `reledmac 2.18.0`**
After updating reledmac, and before any new compilation, you need to clean your `.aux` files, if you use `\edlabel` or related.

**A.20 Migration to `reledmac 2.21.0`**
Previously, there was a bug, which meant that the description in the handbook was incorrect. If you wrote

```
The \edtext{creature\edindex{elephant} was quite unafraid}\{\Afootnote{Of the mouse, that is.}}
```

"elephant" was indexed in the main text and in the critical footnotes. With the new version of reledmac, it is indexed only in main text. If you also want to index it in critical footnotes, do

```
The \edtext{creature\edindex{elephant} was quite unafraid}\{\Afootnote{\edindex{elephant}Of the mouse, that is.}}
```

**A.21 Migration to `reledmac 2.24.0`**
When using `\labelpstarttrue`, a spurious space was introduced after the pstart number (only for normal typesetting, not while typesetting in parallel). The new version of the package has deleted this spurious space. If you consider that it was NOT a spurious space, you should add it manually in your definition of `\thepstart`.

**A.22 Migration to `reledmac 2.26.0`**
You must delete your `.aux` file after having upgraded to this new version of reledmac.

**A.23 Migration to `reledmac 2.27.1`**
This release fixes spurious space in `\hidenumbering`. If you considered this spurious space as normal, you must insert it manually using.

```
xx\hidenumbering\ xx
```

To get the space after `xx`.

**A.24 Migration to `reledmac 2.30.0`**
If you have multiple annotations for the same line, these are now separated with a comma in the margin. You can use `\setlinenumannotationsep` to change the separator.
A.25 Migration to \texttt{reledmac} 2.31.1

If you use \texttt{\textbackslash xgroupbyline}, the indentation of the notes has been deleted, in order to have the same behavior as for normal critical notes.

Use \texttt{\textbackslash xparindent} to restore indentation.

Appendix B  Auxiliary softwares

This appendix lists some software and tools related to \texttt{reledmac} that may be useful.

B.1 \texttt{samewords}

The \texttt{samewords} program (Michael Stenskjær Christensen) automatically adds \texttt{\textbackslash sameword} commands (6.3 p.33) into a \texttt{.tex} file.

\url{https://samewords.readthedocs.io/en/latest/}

B.2 critical-keys for \texttt{Emacs}

The \texttt{Emacs} editor has a package to help inserting \texttt{reledmac}’s commands (Juan Manuel Macías Chain).

\url{https://gitlab.com/maciaschain/critical-keys}

B.3 critical-marks for \texttt{Emacs}

A set of functions for \texttt{Emacs} that run in the export process from Org Mode to LaTeX and replace a series of simple textual marks with the basic \texttt{reledmac}’s commands (Juan Manuel Macías Chain) \url{https://gitlab.com/maciaschain/critical-marks}

B.4 Import from TEI

B.5 Import from TEI

There are multiple tools to convert from XML-TEI to \texttt{reledmac}. Here is a non exhaustive-list:

- \url{http://ciham-digital.huma-num.fr/teicat/}
- \url{https://github.com/fizzbucket/tei_transformer}
- \url{https://github.com/TEIC/Stylesheets}
- \url{http://lombardpress.org/print/}
- \url{https://github.com/Jean-Baptiste-Camps/TEItolatex}

Please, tell us if you know of other tools.
