

Package ‘CVST’

February 21, 2022

Type Package

Title Fast Cross-Validation via Sequential Testing

Version 0.2-3

Date 2022-02-19

Depends kernlab,Matrix

Author Tammo Krueger, Mikio Braun

Maintainer Tammo Krueger <tammokrueger@googlemail.com>

Description The fast cross-validation via sequential testing (CVST) procedure is an improved cross-validation procedure which uses non-parametric testing coupled with sequential analysis to determine the best parameter set on linearly increasing subsets of the data. By eliminating under-performing candidates quickly and keeping promising candidates as long as possible, the method speeds up the computation while preserving the capability of a full cross-validation. Additionally to the CVST the package contains an implementation of the ordinary k-fold cross-validation with a flexible and powerful set of helper objects and methods to handle the overall model selection process. The implementations of the Cochran's Q test with permutations and the sequential testing framework of Wald are generic and can therefore also be used in other contexts.

Examples

```
ns = noisySine(100)
svm = constructSVMlearner()
params = constructParams(kernel="rbfdot", sigma=10^(-3:3), nu=c(0.05, 0.1, 0.2, 0.3))
opt = fastCV(ns, svm, params, constructCVSTModel())
```

cochranq.test

Cochran's Q Test with Permutation

Description

Performs the Cochran's Q test on the data. If the data matrix contains too few elements, the chisquare distribution of the test statistic is replaced by a permutation variant.

Usage

```
cochranq.test(mat)
```

Arguments

mat The data matrix with the individuals in the rows and treatments in the columns.

Value

Returns a htest object with the usual entries.

Author(s)

Tammo Krueger <tammokrueger@googlemail.com>

Examples

```
mat = matrix(c(rep(0, 10), 1, 1, 0, 0, 0, 1, 0, 0, 0, 0,
1, 0, 0, 0, 1, 0, 0, 0, 0, 1, 0, 1, 0, 1, 0, 0, 0, 0, 1,
0, 0, 1, 1, 1, 0, 0, 0, 1, 1, 1, 0, 1, 0, 1, 0, 1, 1, 0,
1, 1, 1, 0, 1, 0, 1, 1, 1, 1, 0, 1, 0, 1), ncol=4)
cochranq.test(mat)
mat = matrix(c(rep(0, 7), 1, rep(0, 12), 1, 1, 0, 1,
rep(0, 5), 1, 0, 1, 0, 1, 0, 0, 0, 1, 0, 1), nrow=8)
cochranq.test(mat)
```

constructCVSTModel *Setup for a CVST Run.*

Description

This is an helper object of type CVST.setup containing all necessary parameters for a CVST run.

Usage

```
constructCVSTModel(steps = 10, beta = 0.1, alpha = 0.01,
similaritySignificance = 0.05, earlyStoppingSignificance = 0.05,
earlyStoppingWindow = 3, regressionSimilarityViaOutliers = FALSE)
```

Arguments

steps	Number of steps CVST should run
beta	Significance level for H0.
alpha	Significance level for H1.
similaritySignificance	Significance level of the similarity test.
earlyStoppingSignificance	Significance level of the early stopping test.

earlyStoppingWindow

Size of the early stopping window.

regressionSimilarityViaOutliers

Should the less strict outlier-based similarity measure for regression tasks be used.

Value

A CVST.setup object suitable for [fastCV](#).

constructData

Construction and Handling of CVST.data Objects

Description

The CVST methods needs a structured interface to both regression and classification data sets. These helper methods allow the construction and consistence handling of these types of data sets.

Usage

```
constructData(x, y)
getN(data)
getSubset(data, subset)
getX(data, subset = NULL)
shuffleData(data)
isClassification(data)
isRegression(data)
```

Arguments

x	The feature data as vector or matrix.
y	The observed values (regressands/labels) as list, vector or factor.
data	A CVST.data object generated via constructData.
subset	A index set.

Value

constructData returns a CVST.data object. getN returns the number of data points in the data set. getSubset returns a subset of the data as a CVST.data object, while getX just return the feature data. shuffleData returns a randomly shuffled instance of the data.

Author(s)

Tammo Krueger <tammokrueger@googlemail.com>

Examples

```
nsine = noisySine(10)
isClassification(nsine)
isRegression(nsine)
getN(nsine)
getX(nsine)
nsineShuffled = shuffleData(nsine)
getX(nsineShuffled)
getSubset(nsineShuffled, 1:3)
```

constructLearner

Construction of Specific Learners for CVST

Description

These methods construct a CVST.learner object suitable for the CVST method. These objects provide the common interface needed for the [CV](#) and [fastCV](#) methods. We provide kernel logistic regression, kernel ridge regression, support vector machines and support vector regression as fully functional implementation templates.

Usage

```
constructLearner(learn, predict)
constructKlogRegLearner()
constructKRRLearner()
constructSVMLearner()
constructSVRLearner()
```

Arguments

learn	The learning methods which takes a CVST.data and list of parameters and return a model.
predict	The prediction method which takes a model and CVST.data and returns the corresponding predictions.

Details

The nu-SVM and nu-SVR are build on top the corresponding implementations of the kernlab package (see reference). In the list of parameters these implementations expect an entry named `kernel`, which gives the name of the kernel that should be used, an entry named `nu` specifying the nu parameter, and an entry named `C` giving the C parameter for the nu-SVR.

The KRR and KLR also expect `kernel` and necessary other parameters to construct the kernel. Both methods expect a `lambda` parameter and KLR additionally a `tol` and `maxiter` parameter in the parameter list.

Note that the `lambda` of KRR/KLR and the `C` parameter of SVR are scaled by the data set size to allow for comparable results in the fast CV loop.

Value

Returns a learner of type `CVST.learner` suitable for `CV` and `fastCV`.

Examples

```
# SVM
ns = noisySine(100)
svm = constructSVMlearner()
p = list(kernel="rbfdot", sigma=100, nu=.1)
m = svm$learn(ns, p)
nsTest = noisySine(1000)
pred = svm$predict(m, nsTest)
sum(pred != nsTest$y) / getN(nsTest)
# Kernel logistic regression
klr = constructKlogRegLearner()
p = list(kernel="rbfdot", sigma=100, lambda=.1/getN(ns), tol=10e-6, maxiter=100)
m = klr$learn(ns, p)
pred = klr$predict(m, nsTest)
sum(pred != nsTest$y) / getN(nsTest)
# SVR
ns = noisySinc(100)
```

```

svr = constructSVRLearner()
p = list(kernel="rbfdot", sigma=100, nu=.1, C=1*getN(ns))
m = svr$learn(ns, p)
nsTest = noisySinc(1000)
pred = svr$predict(m, nsTest)
sum((pred - nsTest$y)^2) / getN(nsTest)
# Kernel ridge regression
krr = constructKRRLearner()
p = list(kernel="rbfdot", sigma=100, lambda=.1/getN(ns))
m = krr$learn(ns, p)
pred = krr$predict(m, nsTest)
sum((pred - nsTest$y)^2) / getN(nsTest)

```

constructParams

Construct a Grid of Parameters

Description

This is a helper function which, given a named list of parameter choices, expand the complete grid and returns a `CVST.params` object suitable for `CV` and `fastCV`.

Usage

```
constructParams(...)
```

Arguments

... The parameters that should be expanded.

Value

Returns a `CVST.params` which is basically a named list of possible parameter values.

Author(s)

Tammo Krueger <tammokrueger@googlemail.com>

See Also

[fastCV](#)

Examples

```

params = constructParams(kernel="rbfdot", sigma=10^(-1:5), nu=c(0.1, 0.2))
# the expanded grid contains 14 parameter lists:
length(params)

```

`constructSequentialTest`*Construct and Handle Sequential Tests.*

Description

These functions handle the construction and calculation with sequential tests as introduced by Wald (1947). `getCVSTTest` constructs a special sequential test as introduced in Krueger (2011). `testSequence` test a sequence of 0/1 whether it is distributed according to H0 or H1.

Usage

```
constructSequentialTest(piH0 = 0.5, piH1 = 0.9, beta, alpha)
getCVSTTest(steps, beta = 0.1, alpha = 0.01)
testSequence(st, s)
plotSequence(st, s)
```

Arguments

<code>piH0</code>	Probability of the binomial distribution for H0.
<code>piH1</code>	Probability of the binomial distribution for H1.
<code>beta</code>	Significance level for H0.
<code>alpha</code>	Significance level for H1.
<code>steps</code>	Number of steps the CVST procedure should be executed.
<code>st</code>	A sequential test of type CVST. <code>sequentialTest</code> .
<code>s</code>	A sequence of 0/1 values.

Value

`constructSequentialTest` and `getCVSTTest` return a `CVST.sequentialTest` with the specified properties. `testSequence` returns 1, if H1 can be expected, -1 if H0 can be accepted, and 0 if the test needs more data for a decision. `plotSequence` gives a graphical impression of the this testing procedure.

st = getCVSTTest(10)
s = rbinom(10,1, .5)
plotSequence(st, s)
testSequence(st, s)
```

CV*Perform a k-fold Cross-validation*

Description

Performs the usual k-fold cross-validation procedure on a given data set, parameter grid and learner.

Usage

```
CV(data, learner, params, fold = 5, verbose = TRUE)
```

Arguments

data	The data set as CVST .data object.
learner	The learner as CVST .learner object.
params	the parameter grid as CVST .params object.
fold	The number of folds that should be generated for each set of parameters.
verbose	Should the procedure report the performance for each model?

Value

Returns the optimal parameter settings as determined by k-fold cross-validation.

opt = CV(ns, svm, params)
```

fastCV*The Fast Cross-Validation via Sequential Testing (CVST) Procedure*

Description

CVST is an improved cross-validation procedure which uses non-parametric testing coupled with sequential analysis to determine the best parameter set on linearly increasing subsets of the data. By eliminating underperforming candidates quickly and keeping promising candidates as long as possible, the method speeds up the computation while preserving the capability of a full cross-validation.

Usage

```
fastCV(train, learner, params, setup, test = NULL, verbose = TRUE)
```

Arguments

train	The data set as CVST.data object.
learner	The learner as CVST.learner object.
params	the parameter grid as CVST.params object.
setup	A CVST.setup object containing the necessary parameter for the CVST procedure.
test	An independent test set that should be used at each step. If NULL then the remaining data after learning a model at each step is used instead.
verbose	Should the procedure report the performance after each step?

Value

Returns the optimal parameter settings as determined by fast cross-validation via sequential testing.

```

noisyDonoho

Generate Donoho's Toy Data Sets

Description

This function allows to generate noisy variants of the toy signals introduced by Donoho (see reference section). The scaling is chosen to reflect the setting as discussed in the original paper.

Usage

```
noisyDonoho(n, fun = doppler, sigma = 1)
blocks(x, scale = 3.656993)
bumps(x, scale = 10.52884)
doppler(x, scale = 24.22172)
heavisine(x, scale = 2.356934)
```

Arguments

n	Number of data points that should be generated.
fun	Function to use to generate the data.
sigma	Standard deviation of the noise component.
x	Number of data points that should be generated.
scale	Scaling parameter.

Value

Returns a data set of type CVST.data

plot(bumpsSet)
dopplerSet = noisyDonoho(1000, fun=doppler)
plot(dopplerSet)
```

`noisySine`*Regression and Classification Toy Data Set*

Description

Regression and Classification Toy Data Set based on the sine and sinc function.

Usage

```
noisySine(n, dim = 5, sigma = 0.25)
noisySinc(n, dim = 2, sigma = 0.1)
```

Arguments

<code>n</code>	Number of data points that should be generated.
<code>dim</code>	Intrinsic dimensionality of the data set (see references for details).
<code>sigma</code>	Standard deviation of the noise component.

Value

Returns a data set of type CVST.data
