

Package ‘completejourney’

July 22, 2025

Title Retail Shopping Data

Version 1.1.0

Description Retail shopping transactions for 2,469 households over one year.
Originates from the 84.51° Complete Journey 2.0 source files
<<https://www.8451.com/area51>> which also includes useful metadata on
products, coupons, campaigns, and promotions.

License CC0

LazyData true

Depends R (>= 2.10)

Imports curl, dplyr, tibble, progress, stringr, zeallot

Suggests lubridate, knitr, rmarkdown, testthat

--------------	-----------

campaigns	<i>Campaigns to household data.</i>
-----------	-------------------------------------

Description

Data on the campaigns received by each household in the Complete Journey study. Each household received a different set of marketing campaigns.

Usage

```
campaigns
```

Format

A data frame with 6,589 rows and 2 variables

- `campaign_id`: Uniquely identifies each campaign; Ranges 1-27
- `household_id`: Uniquely identifies each household

Value

```
campaigns      a tibble
```

Source

84.51°, Customer Journey study, <http://www.8451.com/area51/>

Examples

```
# full data set
campaigns

# Join household demographics metadata to campaigns dataset
require("dplyr")
campaigns %>%
  left_join(demographics, "household_id")
```

campaign_descriptions *Campaign metadata.*

Description

Campaign metadata for all campaigns run for the Customer Journey study. This dataset gives the length of time for which a campaign runs. So, any coupons received as part of a campaign are valid within the dates contained in this dataset.

Usage

```
campaign_descriptions
```

Format

A data frame with 27 rows and 4 variables

- `campaign_id`: Uniquely identifies each campaign; Ranges 1-27
- `campaign_type`: Type of campaign (Type A, Type B, Type C)
- `start_date`: Start date of campaign
- `end_date`: End date of campaign

Value

```
campaign_descriptions  
  a tibble
```

Source

84.51°, Customer Journey study, <http://www.8451.com/area51/>

Examples

```
# full data set  
campaign_descriptions  
  
# Join product campaign metadata to campaign_table dataset  
require("dplyr")  
campaigns %>%  
  left_join(campaign_descriptions, "campaign_id")
```

completejourney	completejourney <i>package</i>
-----------------	--------------------------------

Description

Retail shopping transactions for 2,469 households over one year

coupons	<i>Coupon metadata.</i>
---------	-------------------------

Description

Coupon metadata for all coupons used in campaigns advertised to households participating in the Customer Journey study.

Usage

coupons

Format

A data frame with 116,204 rows and 3 variables

- coupon_upc: Uniquely identifies each coupon (unique to household and campaign)
- product_id: Uniquely identifies each product
- campaign_id: Uniquely identifies each campaign

Value

coupons a tibble

Source

84.51°, Customer Journey study, <http://www.8451.com/area51/>

Examples

```
# full data set
coupons

# Join product metadata to coupon dataset
require("dplyr")
coupons %>%
  left_join(products, "product_id")
```

coupon_redemptions *Coupon redemption data.*

Description

Coupon data identifying the coupons that each household redeemed in the Complete Journey study.

Usage

```
coupon_redemptions
```

Format

A data frame with 2,102 rows and 4 variables

- household_id: Uniquely identifies each household
- coupon_upc: Uniquely identifies each coupon (unique to household and campaign)
- campaign_id: Uniquely identifies each campaign
- redemption_date: Date when the coupon was redeemed

Source

84.51°, Customer Journey study, <http://www.8451.com/area51/>

Examples

```
# full data set
coupon_redemptions

# Join coupon metadata to coupon_redempt dataset
require("dplyr")
coupon_redemptions %>%
  left_join(coupons, "coupon_upc")
```

demographics

Household demographic metadata.

Description

Household demographic metadata for households participating in the Customer Journey study. Due to nature of the data, the demographic information is not available for all households.

Usage

```
demographics
```

Format

A data frame with 801 rows and 8 variables

- household_id: Uniquely identifies each household
- age: Estimated age range
- income: Household income range
- home_ownership: Homeowner status (Homeowner, Renter, Unknown)
- marital_status: Marital status (Married, Single, Unknown)
- household_size: Size of household up to 5+
- household_comp: Household composition description
- kids_count: Number of children present up to 3+

Value

```
demographics  a tibble
```

Source

84.51°, Customer Journey study, <http://www.8451.com/area51/>

Examples

```
# full data set
demographics

# Transaction line items that don't have household metadata
require("dplyr")
transactions_sample %>%
  anti_join(demographics, "household_id")
```

get_data	<i>Download full promotions and transactions data simultaneously.</i>
----------	---

Description

The promotions and transactions data sets are too large to be contained within the package. `get_data()` is a convenience function to download both full promotions and transactions data sets simultaneously from the source GitHub repository. An internet connection is required.

Usage

```
get_data(which = "both", verbose = TRUE)
```

Arguments

which	Character string of one or more data sets to be downloaded. Can be one of the following; default is "both": <ul style="list-style-type: none">• "both"• "promotions"• "transactions"
verbose	Logical indicator whether or not to download silently.

Value

Downloading a single data set will result in a tibble whereas downloading multiple data sets will return a list containing each tibble. For specific details on a given data set see the data sets respective help file (i.e. `?transactions_sample`).

Source

Downloading from <https://github.com/bradleyboehmke/completejourney/tree/master/data>. Data originated from 84.51°, Customer Journey study, <http://www.8451.com/area51/> and were processed for analysis.

See Also

Use `%<-%` for unpacking a list with multiple tibbles to their own global environment tibble. You can also download a single data set with `get_promotions` and `get_transactions`.

Examples

```
# download transactions and promotions data sets
# requires internet connection
c(promotions, transactions) %<-% get_data(which = 'both')
```

get_promotions	<i>Get full Complete Journey promotions data set.</i>
----------------	---

Description

The complete promotions data set for the Complete Journey is too large to be contained within the package. `get_promotions()` provides an efficient method for downloading the full data set from the source GitHub repository.

Usage

```
get_promotions(verbose = FALSE)
```

Arguments

`verbose` Logical indicator whether or not to download silently.

Value

A data frame with 20,940,529 rows and 5 variables

Source

Downloading from <https://github.com/bradleyboehmke/completejourney/tree/master/data>. Data originated from 84.51°, Customer Journey study, <http://www.8451.com/area51/> and were processed for analysis.

See Also

`promotions_sample` for details regarding the variables.

Examples

```
# requires internet connection
promotions <- get_promotions()
```

get_transactions	<i>Get full Complete Journey transactions data set.</i>
------------------	---

Description

The complete transactions data set for the Complete Journey is too large to be contained within the package. `get_transactions()` provides an efficient method for downloading the full data set from the source GitHub repository.

Usage

```
get_transactions(verbose = FALSE)
```

Arguments

`verbose` Logical indicator whether or not to download silently.

Value

A data frame with 1,469,307 rows and 5 variables

Source

Downloading from <https://github.com/bradleyboehmke/completejourney/tree/master/data>. Data originated from 84.51°, Customer Journey study, <http://www.8451.com/area51/> and were processed for analysis.

See Also

[transactions_sample](#) for details regarding the variables.

Examples

```
# requires internet connection
transactions <- get_transactions()
```

products

Product metadata.

Description

Product metadata for all products purchased by households participating in the Customer Journey study.

Usage

products

Format

A data frame with 92,331 rows and 7 variables

- `product_id`: Uniquely identifies each product
- `manufacturer_id`: Uniquely identifies each manufacturer
- `department`: Groups similar products together
- `brand`: Indicates Private or National label brand
- `product_category`: Groups similar products together at lower level
- `product_type`: Groups similar products together at lowest level
- `package_size`: Indicates package size (not available for all products)

Value

products a tibble

Source

84.51°, Customer Journey study, <http://www.8451.com/area51/>

Examples

```
# full data set
products

# Transaction line items that don't have product metadata
require("dplyr")
transactions_sample %>%
  anti_join(products, "product_id")
```

promotions_sample *Sampling of the full promotions data set.*

Description

A sampling of the promotions data from the Complete Journey study signifying whether a given product was featured in the weekly mailer or was part of an in-store display (other than regular product placement).

Usage

```
promotions_sample
```

Format

A data frame with 360,535 rows and 5 variables

- product_id: Uniquely identifies each product
- store_id: Uniquely identifies each store
- display_location: Display location (see details for range of values)
- mailer_location: Mailer location (see details for range of values)
- week: Week of the transaction; Ranges 1-53

Value

```
promotions_sample
  a tibble
```

Display Location Codes

- 0 - Not on Display
- 1 - Store Front
- 2 - Store Rear
- 3 - Front End Cap
- 4 - Mid-Aisle End Cap
- 5 - Rear End Cap
- 6 - Side-Aisle End Cap
- 7 - In-Aisle
- 9 - Secondary Location Display
- A - In-Shelf

Mailer Location Codes

- 0 - Not on ad
- A - Interior page feature
- C - Interior page line item
- D - Front page feature
- F - Back page feature
- H - Wrap from feature
- J - Wrap interior coupon
- L - Wrap back feature
- P - Interior page coupon
- X - Free on interior page
- Z - Free on front page, back page or wrap

Source

84.51°, Customer Journey study, <http://www.8451.com/area51/>

See Also

Use `get_promotions` to download the entire promotions data containing all 20,940,529 rows.

Examples

```
# sampled promotions data set
promotions_sample

# Join promotions to transactions to analyze
# product promotion/location
require("dplyr")
transactions_sample %>%
  left_join(promotions_sample,
            c("product_id", "store_id", "week"))
```

transactions_sample *Sampling of the full Complete Journey transactions.*

Description

A sampling of all products purchased by households within the Complete Journey study. Each line found in this table is essentially the same line that would be found on a store receipt. This is only a subsample of the complete data set to keep package size manageable.

Usage

```
transactions_sample
```

Format

A data frame with 75,000 rows and 11 variables

household_id Uniquely identifies each household

store_id Uniquely identifies each store

basket_id Uniquely identifies a purchase occasion

product_id Uniquely identifies each product

quantity Number of the products purchased during the trip

sales_value Amount of dollars retailer receives from sale

retail_disc Discount applied due to retailer's loyalty card program

coupon_disc Discount applied due to manufacturer coupon

coupon_match_disc Discount applied due to retailer's match of manufacturer coupon

week Week of the transaction; Ranges 1-53

transaction_timestamp Date and time of when the transaction occurred

Value

transactions_sample
a tibble

Source

84.51°, Customer Journey study, <http://www.8451.com/area51/>

See Also

Use [get_transactions](#) to download the entire transactions data containing all 1,469,307 rows.

Examples

```
transactions_sample
```

%<-%

Assign values to names

Description

See [%<-%](#) for more details.

Usage

```
x %<-% value
```

Arguments

x A name structure.
value A list of values, vector of values, or R objects to assign.
