1 Initial Code

In this part we define a few commands that are used later on.

\@ptsize

This control sequence is used to store the second digit of the pointsize we are typesetting in. So, normally, it’s value is one of 0, 1 or 2.

1 (*letter)
2 \newcommand\@ptsize{}

1.1 Setting Paper Sizes

The variables \paperwidth and \paperheight should reflect the physical paper size after trimming. For desk printer output this is usually the real paper size since there is no post-processing.

3 \DeclareOption{a4paper}
4 {\setlength\paperheight {297mm}\%}
5 \setlength\paperwidth {210mm}}
6 \DeclareOption{a5paper}
7 {\setlength\paperheight {210mm}\%}
8 \setlength\paperwidth {148mm}}
9 \DeclareOption{b5paper}
10 {\setlength\paperheight {250mm}\%}
11 \setlength\paperwidth {176mm}}
12 \DeclareOption{letterpaper}
13 {\setlength\paperheight {11in}\%
14 \setlength\paperwidth{8.5in}\setlength\paperheight{14in} \\
15 \DeclareOption{legalpaper}\setlength\paperheight{14in}\setlength\paperwidth{8.5in} \\
16 \DeclareOption{executivepaper}\setlength\paperheight{10.5in}\setlength\paperwidth{7.25in} \\

The option \texttt{landscape} switches the values of \texttt{\paperheight} and \texttt{\paperwidth}, assuming the dimensions were given for portrait paper.

1.2 Choosing the type size

The type size options are handled by defining \texttt{\@ptsize} to contain the last digit of the size in question and branching on \texttt{ifcase} statements. This is done for historical reasons to stay compatible with other packages that use the \texttt{\@ptsize} variable to select special actions. It makes the declarations of size options less than 10pt difficult, although one can probably use 9 and 8 assuming that a class wont define both 8pt and 18pt options.

14 \DeclareOption{10pt}{\renewcommand\@ptsize{0}} \\
15 \DeclareOption{11pt}{\renewcommand\@ptsize{1}} \\
16 \DeclareOption{12pt}{\renewcommand\@ptsize{2}}

1.3 Two-side or one-side printing

Two-sided printing was not supported in the \LaTeX{} 2.09 version of this document class.

14 \if@compatibility \\
15 \DeclareOption{twoside}{\latexerr{No ‘twoside’ layout for letters}%
\@eha} \\
16 \else \\
17 \DeclareOption{twoside}{\twosidetrue \mparswitchtrue} \\
18 \fi \\
19 \DeclareOption{oneside}{\twosidetrue \mparswitchfalse}

1.4 Draft option

If the user requests \texttt{draft} we show any overfull boxes. We could probably add some more interesting stuff to this option.

14 \DeclareOption{draft}{\setlength\overfullrule{5pt}} \\
15 \DeclareOption{final}{\setlength\overfullrule{0pt}}

1.5 Equation numbering on the left

The option \texttt{leqno} can be used to get the equation numbers on the left side of the equation.

14 \DeclareOption{leqno}{\input{leqno.clo}}
1.6 Flush left displays

The option fleqn redefines the displayed math environments in such a way that they come out flush left, with an indentation of \texttt{mathindent} from the prevailing left margin.

\begin{verbatim}
38 \DeclareOption{fleqn}{\input{fleqn.clo}}
\end{verbatim}

2 Executing Options

Here we execute the default options to initialize certain variables.

\begin{verbatim}
39 \ExecuteOptions{letterpaper,10pt,oneside,onecolumn,final}
\end{verbatim}

The \texttt{\ProcessOptions} command causes the execution of the code for every option foo which is declared and for which the user typed the foo option in his \texttt{\documentclass} command. For every option bar he typed, which is not declared, the option is assumed to be a global option. All options will be passed as document options to any \texttt{\usepackage} command in the document preamble.

\begin{verbatim}
40 \ProcessOptions
\end{verbatim}

Now that all the options have been executed we can load the chosen class option file that contains all size dependent code.

\begin{verbatim}
41 \input{size1@ptsize.clo}
\end{verbatim}

3 Loading Packages

The standard class files do not load additional packages.

4 Document Layout

In this section we are finally dealing with the nasty typographical details.

4.1 Paragraphing

\texttt{\lineskip} and \texttt{\normallineskip} These parameters control \TeX’s behavior when two lines tend to come too close together.

\begin{verbatim}
42 \setlength\lineskip{1\p@}
43 \setlength\normallineskip{1\p@}
\end{verbatim}

\texttt{\baselinestretch} This is used as a multiplier for \texttt{\baselineskip}. The default is to \texttt{not} stretch the baselines.

\begin{verbatim}
44 \renewcommand\baselinestretch{}
\end{verbatim}

\texttt{\parskip} \texttt{\parindent} gives extra vertical space between paragraphs and \texttt{\parindent} is the width of the paragraph indentation. Letters are typeset without paragraph indentation.

\begin{verbatim}
45 \setlength\parskip{0.7em}
46 \setlength\parindent{0\p@}
\end{verbatim}
\@lowpenalty The commands \nopagebreak and \nolinebreak put in penalties to discourage these breaks at the point they are put in. They use \@lowpenalty, \@medpenalty or \@highpenalty, dependent on their argument.

\@medpenalty
\@highpenalty

\clubpenalty These penalties are used to discourage club and widow lines. Because we use their default values we only show them here, commented out.

\@lowpenalty 51
\@medpenalty 151
\@highpenalty 301

\widowpenalty

\displaywidowpenalty Discourage (but not so much) widows in front of a math display and forbid breaking directly in front of a display. Allow break after a display without a penalty. Again the default values are used, therefore we only show them here.

\predisplaypenalty 10000
\postdisplaypenalty 0

\interlinepenalty Allow the breaking of a page in the middle of a paragraph.

\brokenpenalty We allow the breaking of a page after a hyphenated line.

\textwidth When we are in compatibility mode we have to make sure that the dimensions of the printed area are not different from what the user was used to see.

\if@compatibility
\setlength\textwidth{365\p@}
\fi

4.2 Page Layout

All margin dimensions are measured from a point one inch from the top and lefthand side of the page.

4.2.1 Vertical spacing

\headheight The \headheight is the height of the box that will contain the running head. The \headsep is the distance between the bottom of the running head and the top of the text. \topskip is the \baselineskip for the first line on a page, its value depends on the size option that was specified. Therefore it is initialized in one of the size1x.clo files.

\setlength\headheight{12\p@}
\setlength\headsep  {45\p@}

\footskip The distance from the baseline of the box which contains the running footer to the baseline of last line of text is controlled by the \footskip. Bottom of page:

\setlength\footskip{25\p@}

4.2.2 The dimension of text

\textwidth
Now that we have computed the width of the text, we have to take care of the height. The \texttheight is the height of text (including footnotes and figures, excluding running head and foot).

\setlength\texttheight{505\p@}
\fi

In native mode we use the dimensions as they were computed by one of the \xxpt options, together with one of the ..paper options.

4.2.3 Margins

The values of \oddsidemargin and \evensidemargin are computed from those of \paperwidth and \textwidth.

\setlength\oddsidemargin{53pt}
\setlength\evensidemargin{53pt}
\setlength\marginparwidth{90pt}
\else
\setlength\oddsidemargin{\tempdim-a\paperwidth}
\addtolength\tempdim-a{-2in}
\addtolength\tempdim-a{-\textwidth}
\setlength\oddsidemargin{.5\tempdim-a}
\setlength\evensidemargin{\oddsidemargin}
\setlength\marginparwidth{90\p@}
\fi

The horizontal space between the main text and marginal notes is determined by \marginparsep, the minimum vertical separation between two marginal notes is controlled by \marginparpush.

\setlength\marginparsep{11\p@}
\setlength\marginparpush{5\p@}
\topmargin
The \topmargin is the distance between the top of ‘the printable area’ –which is 1 inch below the top of the paper– and the top of the box which contains the running head.
It can now be computed from the values set above.
\setlength\topmargin{27pt}

4.2.4 Footnotes

\footnotesep \footnotesep is the height of the strut placed at the beginning of every footnote. It equals the height of a normal \footnotesize strut in this class, thus no extra space occurs between footnotes.
\setlength\footnotesep{12\p@}
\footins \skip\footins is the space between the last line of the main text and the top of the first footnote.
\setlength{\skip\footins}{10\p@ \plus 2\p@ \minus 4\p@}
4.3 Page Styles

The page style foo is defined by defining the command \ps@foo. This command should make only local definitions. There should be no stray spaces in the definition, since they could lead to mysterious extra spaces in the output (well, that's something that should be always avoided).

\@evenhead \@oddhead \@evenfoot \@oddfoot The \ps@... command defines the macros \@oddhead, \@oddfoot, \@evenhead, and \@evenfoot to define the running heads and feet—e.g., \@oddhead is the macro to produce the contents of the heading box for odd-numbered pages. It is called inside an \hbox of width \textwidth.

4.3.1 Marking conventions

To make headings determined by the sectioning commands, the page style defines the commands \chaptermark, \sectionmark, ..., where \chaptermark{⟨text⟩} is called by \chapter to set a mark, and so on.

The \...mark commands and the \...head macros are defined with the help of the following macros. (All the \...mark commands should be initialized to no-ops.)

\markboth{⟨left⟩}{⟨right⟩}: Adds both marks.
\markright{⟨right⟩}: Adds a ‘right’ mark.
\leftmark: Used in the \@oddhead, \@oddfoot, \@evenhead or \@evenfoot macros, it gets the current ‘left’ mark. \leftmark works like \TeX's \botmark command.
\rightmark: Used in the \@oddhead, \@oddfoot, \@evenhead or \@evenfoot macros, it gets the current ‘right’ mark. \rightmark works like \TeX's \firstmark command.

The marking commands work reasonably well for right marks ‘numbered within’ left marks—e.g., the left mark is changed by a \chapter command and the right mark is changed by a \section command. However, it does produce somewhat anomalous results if two \markboth's occur on the same page.

Commands like \tableofcontents that should set the marks in some page styles use a \@mkboth command, which is \let by the pagestyle command (\ps@...) to \markboth for setting the heading or to \@gobbletwo to do nothing.

4.3.2 Defining the page styles

The page styles empty and plain are defined in the \TeX kernel (1tpage.dtx), but these definitions are changed to a simpler version for this document class.

\ps@headings The definition of the page style headings has to be different for two sided printing than it is for one sided printing.

81 \if@twoside
82 \def\ps@headings{%
83 \let\@oddfoot\@empty\let\@evenfoot\@empty

The running feet are empty in this page style.
5 Document Markup

5.1 Global Declarations

The following declarations, shown with examples, give information about the sender:

- \name{Dr. L. User}: to be used for the return address on the envelope.

\name
\signature
\address
\location
\telephone
\newcommand*{\name[1]}{\def\fromname[#1]}
• $\texttt{signature}$\{Larry User\} : goes after the closing.

\begin{verbatim}
newcommand*\signature[1]{\def\fromsig{#1}}
\end{verbatim}

• $\texttt{address}$\{3245 Foo St. \&\textbackslash Gnu York\} : used as the return address in the letter and on the envelope. If not declared, then an institutional standard address is used.

\begin{verbatim}
newcommand*\address[1]{\def\fromaddress{#1}}
\end{verbatim}

• $\texttt{location}$\{Room 374\} : Acts as modifier to the standard institutional address.

\begin{verbatim}
newcommand*\location[1]{\def\fromlocation{#1}}
\end{verbatim}

• $\texttt{telephone}$\{(415)123-4567\} : Just in case some style puts it on the letter.

\begin{verbatim}
newcommand*\telephone[1]{\def\telephonenum{#1}}
\end{verbatim}

We make sure that the internal control sequences that are used to store the information exist and are empty.

\begin{verbatim}
\fromname \fromsig \fromaddress \fromlocation \telephonenum
\end{verbatim}

\makelabels The $\texttt{makelabels}$ declaration causes mailing labels to be made.

\begin{verbatim}
newcommand*\makelabels{%
At the beginning of the document, we need to activate the $\texttt{@mlabel}$ and $\texttt{@startlabels}$ commands, as well as write $\texttt{@startlabels}$ to the .aux file.
\AtBeginDocument{%
let@startlabels\startlabels
let@mlabel\mlabel
if@filesw\immediate\write\@mainaux{\string@startlabels}\fi}%
At the end of the document we need to write $\texttt{clearpage}$ to the .aux file.
\AtEndDocument{%
if@filesw\immediate\write\@mainaux{\stringclearpage}\fi}
\makelabels is allowed only before the $\texttt{\begin{document}}$ command.
\end{verbatim}
\onlypreamble\makelabels

\subsection*{5.2 The generic letter commands}

$\texttt{letter}$ The letter environment creates a new letter, starting from page 1, with footnotes starting from 1 as well. (The first page is unnumbered.) It has a single argument, which is the addressee and his address, as in

\begin{verbatim}
\begin{letter}{Sam Jones \}
Institute for Retarded Study\}
Princeton, N.J.\}
\end{verbatim}
Local declarations, such as \address, can follow the \begin{letter}.

\newenvironment{letter}[1]
\newpage
\if@twoside \ifodd\c@page
\else\thispagestyle{empty}\null\newpage\fi
\fi
\c@page \@ne
\c@footnote \z@
\interlinepenalty=200 % smaller than the TeXbook value

The \leavevmode and \ignorespaces commands are there for protecting against an empty argument.

The end of the environment possibly writes the address information on the .aux file.

5.2.1 Page breaking control

When the command \stopbreaks is issued no page breaks should occur until \startbreaks is called.

These are needed by \stopbreaks

\long\def\@processto#1{\@xproc #1\@@@%
\ifx\toaddress\@empty
\else
\@yproc #1\@@@%
\fi}
\def\@xproc #1\#2@@@{
\def\toname{#1}
\def\toaddress{#2}}
\long\def\@yproc #1\#2@@@{
\def\toaddress{#2}}
\DeclareRobustCommand\@nobreakvspace{
\@ifstar\@nobreakvspacex\@nobreakvspacex}
\def\@nobreakvspacex#1{\ifvmode
\hskip#1\fi}
This cancels the effect of \stopbreaks.

\startbreaks
The size of the indent to use before the closing of the letter.
\longindention
\newdimen\longindention
\longindention=.5\textwidth

\indentedwidth
The width of the closing of the letter.
\newdimen\indentedwidth
\indentedwidth=\textwidth
\advance\indentedwidth -\longindention

\opening
Text is begun with the \opening command, whose argument generates the salutation, as in
\opening{Dear Henry,}
This should produce everything up to and including the ‘Dear Henry,’ and a \par command that follows. Since there’s a \vfil at the bottom of every page, it can add vertical fill to position a short letter. It should use the following commands:

• \toname : name part of ‘to’ address. Will be one line long.
• \toaddress : address part of ‘to’ address. The lines separated by \\.
• \fromname : name of sender.
• \fromaddress : argument of current \address declaration–null if none. Should use standard institutional address if null.
• \fromlocation : argument of current \location declaration–null if none.
• \telephonenum : argument of current \telephone declaration–null if none.
The body of the letter follows, ended by a `\closing` command, as in

```
\closing{Yours truly,}
```

This command generates the closing matter, and the signature. An obvious thing to do is to use a `\parbox` for the closing and the signature. Should use the following:

- `\fromsig`: argument of current `\signature` declaration or, if null, the `\fromname`.
- `\stopbreaks`: a macro that inhibits page breaking.

```latex
\newcommand\closing[1]{\par\nobreak\vspace{\parskip} %
\stopbreaks
\noindent\ifx\@empty\fromaddress\else\hspace*{\longindentation}\fi
\parbox{\indentedwidth}{\raggedright\ignorespaces #1\[6\medskipamount]\%
\ifx\@empty\fromsig\fromname\else \fromsig \fi\strut} %
\par}
```

Of these three, only `\medskipamount` is actually used above.

```latex
\newcommand\closing[1]{\par\nobreak\vspace{\parindent
\stopbreaks
%\medskipamount=.5\parskip
%\bigskipamount=2\parskip
\fromname
\encl{Foo(2)\Bar}
```

which produces:

```
cc: Tinker
    Evers
    Chance
```

Note the obvious use of `\parbox`.

```latex
\newcommand\cc[1]{\par\nobindent\parbox[t]{\textwidth}{%\hangfrom{\normalfont\ccname: }%\ignorespaces #1\strut}\par}
```

which produces:

```
encl: Foo(2)
```

```latex
\newcommand\encl[1]{\par\nobindent\parbox[t]{\textwidth}{%\hangfrom{\normalfont\enclname: }%\ignorespaces #1\strut}\par}
```

which produces:

```
encl: Foo(2)
```

Of these three, only `\medskipamount` is actually used above.
The only thing \ps needs to do is call \startbreaks, which allows page breaking again.

219 \newcommand*\ps{\par\startbreaks}

\stopletter The \stopletter command is called by \endletter to do the following:

- Add any desired fill or other material at the end of the letter.
- Define \returnaddress to be the return address for the mailing label. More precisely, it is the first argument of the \mlabel command described below. It should be defined to null if the return address doesn’t appear on the labels. Any command, other than \, that should not be expanded until the \mlabel command is actually executed must be preceded by \protect. Whenever possible, \protect commands in the definition of \returnaddress—it’s much more efficient that way. In particular, when the standard return address is used, you should define \returnaddress to something like \protect\standardreturnaddress.

220 \newcommand*\stopletter{}

5.3 Customizing the labels

Commands for generating the labels are put on the .aux file, which is read in and processed by the \end{document} command. You have to define the following two commands:

- \startlabels: Should reset the page layout parameters if necessary.
- \mlabel{⟨return address⟩}{⟨to address⟩}: Command to generate a single label.

\returnaddress The return address for the mailing labels can be stored in this macro.

221 \newcommand*\returnaddress{}

\labelcount A register to count the labels

222 \newcount\labelcount

\startlabels The following \startlabels command sets things up for producing labels in two columns of five 2” × 4-1/4” labels each, suitable for reproducing onto Avery brand number 5352 address labels.

223 \newcommand*\startlabels{\labelcount\z@
224 \pagestyle{empty}%
225 \let@textend\relax
226 \topmargin -50\p@  
227 \headsep \z@  
228 \oddsidemargin -35\p@  
229 \evensidemargin -35\p@  
230 \textheight 10in  
231 \colht\textheight \@colroom\textheight \vsize\textheight 
232 \textwidth 550\p@  
233 \columnsep 26\p@  
234 \ifcase \@ptsize\relax 
235 \normalsize
\@startlabels
\mlabel
\@mlabel
5.4 Lists
5.4.1 General List Parameters
The following commands are used to set the default values for the list environment’s parameters. See the LaTeX manual for an explanation of the meanings of the parameters. Defaults for the list environment are set as follows. First, rightmargin, listparindent and itemindent are set to 0pt. Then, for a Kth level list, the command \@listK is called, where ‘K’ denotes ‘i’, ‘ii’, ..., ‘vi’. (I.e., \@listiii is called for a third-level list.) By convention, \@listK should set \leftmargin to \leftmarginK.

\leftmargin For efficiency, level-one list’s values are defined at top level, and \@listi is defined to set only \leftmargin.
\leftmargini
\leftmarginii
\leftmarginiii
\leftmarginiv
\leftmarginv
\leftmarginvi
The following three are calculated so that they are larger than the sum of \labelsep and the width of the default labels (which are ‘(m)’, ‘vii.’ and ‘M.’).
Here we set the top level leftmargin.

\labelsep \labelsep is the distance between the label and the text of an item; \labelwidth is the width of the label.

\partopsep When the user leaves a blank line before the environment an extra vertical space of \partopsep is inserted, in addition to \parskip and \topsep.

\@beginparpenalty These penalties are inserted before and after a list or paragraph environment. They are set to a bonus value to encourage page breaking at these points.

\@itempenalty This penalty is inserted between list items.

\@listI \@listI defines top level and \@listi values of \leftmargin, \parsep, \topsep, and \itemsep

\@listii Here are the same macros for the higher level lists.
5.4.2 Enumerate
The enumerate environment uses four counters: \textit{enumi}, \textit{enumii}, \textit{enumiii} and \textit{enumiv}, where \textit{enumN} controls the numbering of the \textit{N}th level enumeration.

\begin{verbatim}
\theenumi The counters are already defined in the LaTeX kernel (ltlists.dtx), but their representation is changed here.
\theenumii \theenumiii \theenumiv
\end{verbatim}

\begin{verbatim}
\renewcommand\theenumi{\@arabic\c@enumi}
\renewcommand\theenumii{\@alph\c@enumii}
\renewcommand\theenumiii{\@roman\c@enumiii}
\renewcommand\theenumiv{\@Alph\c@enumiv}
\end{verbatim}

\begin{verbatim}
\labelenumi ... \labelenumiv The commands \textbackslash labelenumi ... \textbackslash labelenumiv generate the label for each item.
\end{verbatim}

\begin{verbatim}
\newcommand\labelenumi{\theenumi.}
\newcommand\labelenumii{\textbullet}
\end{verbatim}

\begin{verbatim}
\newcommand\labelenumiii{\textasteriskcentered}
\newcommand\labelenumiv{\textperiodcentered}
\end{verbatim}

5.4.3 Itemize
Itemization is controlled by \textit{labelitemi}, \textit{labelitemii}, \textit{labelitemiii}, and \textit{labelitemiv}, which define the labels of the various itemization levels: the symbols used are bullet, bold en-dash, asterisk and centered dot.

\begin{verbatim}
\newcommand\labelitemi{\textbullet}
\newcommand\labelitemii{\bfseries \textendash}
\newcommand\labelitemiii{\textasteriskcentered}
\newcommand\labelitemiv{\textperiodcentered}
\end{verbatim}

\begin{verbatim}
\newcommand\makelabel{\textasteriskcentered}
\end{verbatim}

\begin{verbatim}
\newcommand\makelabel{\textperiodcentered}
\end{verbatim}

5.4.4 Description
The description environment is defined here – while the itemize and enumerate environments are defined in the LaTeX kernel (ltlists.dtx).

\begin{verbatim}
\newenvironment{description}
\end{verbatim}

\begin{verbatim}
\end{verbatim}
To change the formatting of the label, you must redefine \descriptionlabel.

\newcommand*{\descriptionlabel}[1]{\hspace{\labelsep}
\normalfont\bfseries #1}

5.5 Defining new environments

5.5.1 Verse

The verse environment is defined by making clever use of the list environment’s parameters. The user types `\` to end a line. This is implemented by `\let` equal `\@centercr`.

\newenvironment{verse}
{\let\=\@centercr
\list{}{\setlength\itemsep{\z@}%
\setlength\itemindent{-15\p@}%
\setlength\listparindent{\itemindent}%
\setlength\rightmargin{\leftmargin}%
\addtolength\leftmargin{15\p@}%
\item[]}
\endlist}

5.5.2 Quotation

The quotation environment is also defined by making clever use of the list environment’s parameters. The lines in the environment are set smaller than `\textwidth`. The first line of a paragraph inside this environment is indented.

\newenvironment{quotation}
{\list{}{\setlength\listparindent{1.5em}%
\setlength\itemindent{\listparindent}%
\setlength\rightmargin{\leftmargin}%
\item[]}
\endlist}

5.5.3 Quote

The quote environment is like the quotation environment except that paragraphs are not indented.

\newenvironment{quote}
{\list{}{\setlength\rightmargin{\leftmargin}}
\item[]}
\endlist}

5.5.4 Theorem

This document class does not define its own theorem environments, the defaults, supplied by the LaTeX kernel (ltthm.dtx) are available.

5.6 Setting parameters for existing environments

5.6.1 Array and tabular

\arraycolsep The columns in an array environment are separated by `2\arraycolsep`.
\setlength{\arraycolsep}{5\p@}
\setlength{\tabcolsep}{6\p@}
\setlength{\arrayrulewidth}{.4\p@}
\setlength{\doublerulesep}{2\p@}
\setlength{\tabbingsep}{\labelsep}
\setlength{\fboxsep}{3\p@}
\setlength{\fboxrule}{.4\p@}
\setlength{\jot}{3\pt}
\def\@eqnnum{\@theequation}
5.7 Font changing

Here we supply the declarative font changing commands that were common in \LaTeX{} version 2.09 and earlier. These commands work in text mode \textit{and} in math mode. They are provided for compatibility, but one should start using the \texttt{\texttt{text...}} and \texttt{\texttt{math...}} commands instead. These commands are redefined using \texttt{@renewfontswitch}, a command with three arguments: the user command to be defined; \LaTeX{} commands to execute in text mode and \LaTeX{} commands to execute in math mode.

\begin{verbatim}
\rm The commands to change the family.
\tt \DeclareOldFontCommand{\rm}{\normalfont\rmfamily}{\mathrm}
\sf \DeclareOldFontCommand{\sf}{\normalfont\sffamily}{\mathsf}
\tt \DeclareOldFontCommand{\tt}{\normalfont\ttfamily}{\mathtt}
\bf The command to change to the bold series. One should use \texttt{\texttt{mdseries}} to explicitly switch back to medium series.
\sf \DeclareOldFontCommand{\bf}{\normalfont\bfseries}{\mathbf}
\it And the commands to change the shape of the font. The slanted and small caps shapes are not available by default as math alphabets, so those changes do nothing in math mode. One should use \texttt{\texttt{upshape}} to explicitly change back to the upright shape.
\it \DeclareOldFontCommand{\it}{\normalfont\itshape}{\mathit}
\sl \DeclareOldFontCommand{\sl}{\normalfont\slshape}{\relax}
\sc \DeclareOldFontCommand{\sc}{\normalfont\scshape}{\relax}
\end{verbatim}

\cal The commands \texttt{\texttt{\texttt{cal}}} and \texttt{\texttt{\texttt{mit}}} should only be used in math mode, outside math mode they have no effect. Currently the New Font Selection Scheme defines these commands to generate warning messages. Therefore we have to define them ‘by hand’.

\begin{verbatim}
\cal \DeclareRobustCommand*{\cal}{\@fontswitch{\relax}{\mathcal}}
\mit \DeclareRobustCommand*{\mit}{\@fontswitch{\relax}{\mathnormal}}
\end{verbatim}

5.8 Footnotes

\footnoterule Usually, footnotes are separated from the main body of the text by a small rule. This rule is drawn by the macro \texttt{\texttt{footnoterule}}. We have to make sure that the rule takes no vertical space (see \texttt{plain.tex}) so we compensate for the natural height of the rule of 0.4pt by adding the right amount of vertical skip.

To prevent the rule from colliding with the footnote we first add a little negative vertical skip, then we put the rule and make sure we end up at the same point where we begun this operation.

\begin{verbatim}
\footnoterule\renewcommand{\footnoterule}{% \kern-\p@ \hrule \@width .4\columnwidth \kern .6\p@}
\c@footnote A counter for footnotes.
\end{verbatim}

353 \% \newcounter{footnote}
The footnote mechanism of \LaTeX calls the macro \texttt{\@makefntext} to produce the actual footnote. The macro gets the text of the footnote as its argument and should use \texttt{\@makefnmark} to produce the mark of the footnote. The macro \texttt{\@makefntext} is called when effectively inside a \texttt{\parbox} of width \texttt{\columnwidth} (i.e., with \texttt{\hsize = \columnwidth}).

An example of what can be achieved is given by the following piece of \TeX code.

\begin{verbatim}
\long\def\@makefntext#1{\
\@setpar{\@@par\
\@tempdima = \hsize\
\advance\@tempdima-10pt\
\parshape \@ne 10pt \@tempdima}\
\par\
\parindent 1em\noindent\
\hb@xt@\z@{\hss\@makefnmark}#1}
\end{verbatim}

The effect of this definition is that all lines of the footnote are indented by 10pt, while the first line of a new paragraph is indented by 1em. To change these dimensions, just substitute the desired value for ‘10pt’ (in both places) or ‘1em’. The mark is flush right against the footnote.

In this document class we use a simpler macro, in which the footnote text is set like an ordinary text paragraph, with no indentation except on the first line of a paragraph, and the first line of the footnote. Thus, all the macro must do is set \texttt{\parindent} to the appropriate value for succeeding paragraphs and put the proper indentation before the mark.

\begin{verbatim}
\newcommand\@makefntext[1]{\noindent\hangindent 5\p@\hb@xt@5\p@{\hss\@makefnmark}#1}
\end{verbatim}

The footnote markers that are printed in the text to point to the footnotes should be produced by the macro \texttt{\@makefnmark}. We use the default definition for it.

\begin{verbatim}
%\renewcommand\@makefnmark{\hbox{$^\@thefnmark\m@th$}}
\end{verbatim}

\section{Initialization}

\subsection{Words}

This document class is for documents prepared in the English language. To prepare a version for another language, various English words must be replaced. All the English words that require replacement are defined below in command names.

\begin{verbatim}
\newcommand*\ccname{cc} \newcommand*\enclname{encl} \newcommand*\pagename{Page} \newcommand*\headtoname{To}
\end{verbatim}

\subsection{Date}

This macro uses the \TeX primitives \texttt{\month}, \texttt{\day} and \texttt{\year} to provide the date of the \LaTeX-run.

\begin{verbatim}
\today
\end{verbatim}
\newcommand*{\today}{\ifcase\month\or January\or February\or March\or April\or May\or June\or July\or August\or September\or October\or November\or December\fi, \number\day, \number\year}

6.3 Two column mode
\columnsep This gives the distance between two columns in two column mode.
367 \setlength{\columnsep}{10\p@}
\columnseprule This gives the width of the rule between two columns in two column mode. We have no visible rule.
368 \setlength{\columnseprule}{0\p@}

6.4 The page style
We have plain pages in this document class by default. We use arabic page numbers.
369 \pagestyle{plain}
370 \pagenumbering{arabic}

6.5 Single or double sided printing
We don’t try to make each page as long as all the others.
371 \raggedbottom
\@texttop The document class letter sets \@texttop to \vskip 0pt plus .00006fil on the first page of a letter, which centers a short letter on the page. This fil value may have to be changed for other letterheads. This setting has to be done after \raggedbottom is executed, since the latter sets \@texttop to \relax.
372 \def\@texttop{\ifnum\c@page=1\vskip \z@ plus.00006fil\relax\fi}
We always start in one column mode.
373 \onecolumn
374 (//letter)

Index
Numbers written in italic refer to the page where the corresponding entry is described; numbers underlined refer to the code line of the definition; numbers in roman refer to the code lines where the entry is used.
