The \texttt{cooking-units} package\footnote{This document corresponds to Benedikt Vitecek v2.00a, dated 2022/03/26.}

Ben Vitecek
b.vitecek@gmx.at

2022/03/26

Abstract

This package enables user to globally format units, to switch between them and change your recipes to a given number of persons. For not implemented units or differences between Imperial and U.S. unit you may have a look at appendix B.

It should be used for light-hearted things like cookery books (and not e.g. scientific texts; use e.g. \texttt{siunitx} for those).

1 Introduction

While writing on a cookery book I used – for some reasons whatsoever – three different units for weight: kilogram (kg), gram (g) and decagram (dag, or older: dkg). Later my mother told me that she doesn’t like it if a cookery book uses more than two different units (for weight in this case). Happily I hardly used Decagram and therefore didn’t have many problems changing the units. But, well ... I am using \LaTeX{} and changing those units by hand seemed not very \LaTeX{}-like, so I started writing some code to convert units. I expanded the code, rewrote it in \LaTeX{}3 (which is much more pleasant than \LaTeX{}2\epsilon) and here it is.
1.1 Supported languages

- German
- English
- French (currently suboptimal)

Want to contribute a new language or make a correction to an existing one? See section 9 for more details. Wanna just check the existing translations? See appendix A.

2 The Commands

This package offers the following commands for number/unit printing (and converting):

- \cunum\langle(label)\rangle\{(options)\}\{(amount)\}\{(space)\}\{(unit-key)\}
- \cutext\langle(label)\rangle\{(options)\}\{(amount)\}\{(unit-key)\}
- \Cutext\langle(label)\rangle\{(options)\}\{(amount)\}\{(unit-key)\}
- \cuam\langle(label)\rangle\{(options)\}\{(amount)\}
- \cusetup\{(options)\}

Numbers and units are printed using \cunum. The numerical part can interpret _ and / as (mixed) fractions and -- as a separator for ranges; to convert units use the option \langle(old-unit)\rangle=\langle(new-unit)\rangle. It furthermore allows the sign ? to be used as a placeholder for not known amounts and raises a warning to remind you that this amount needs a check-up. [(space)] adds a space between the number and the unit using \phantom. For a list of predefined units have a look at table 1. (label) is explained in section 3.

1 kg \cunum{1}{kg}\
2.3 kg \cunum{2.3}{kg}\
2.3 kg \cunum{2,3}{kg}\
2–3 kg \cunum{2--3}{kg}\
2.5–3.5 kg \cunum{2,5--3,5}{kg}\
2500–3500 g \cunum[kg=g]{2.5--3,5}{kg}\
392 °F \cunum[C=F]{200}{C}\
356–392 °F \cunum[C=F]{180--200}{C}\
\frac{1}{2} m \cunum{1/2}{m}\
1\frac{1}{2} m \cunum{1_1/2}{m}\
1\frac{1}{2} m \cunum[m=cm]{1_1/2}{m}\
? ℓ \cunum{?}{ℓ}\
50 dag \cunum{50}{dag}\
5 dag \cunum{5}{dag}\
1.12 m \cunum{1.1234}{m}\

\footnotesize

1You can only get limited information from the internet.
2New keys can be added and defined, see section 4 and section 5 for further information.
3You can customize this behavior, see section 8
Decimal numbers are automatically rounded to 2 digits after the colon, temperatures (C, F, K and Re) are automatically rounded to integers.\textsuperscript{4} \texttt{\textbackslash cutext} and \texttt{\textbackslash Cutext} print the number and the written name of the unit. Since v1.10 it works similar\textsuperscript{5} to \texttt{\textbackslash cunum}: it allows the conversion between units and interprets the numerical part (again \_ and / are used for (mixed) fractions and -- for ranges). Furthermore, \texttt{\textbackslash cutext} and \texttt{\textbackslash Cutext} allow the usages of numerals (see section 8.1 for more information).

1 litre \texttt{\textbackslash cutext\{1\}\{1\}}
1 litre \texttt{\textbackslash Cutext\{1\}\{1\}}
1 to 2 litres \texttt{\textbackslash Cutext\{1--2\}\{1\}}
12 litres \texttt{\textbackslash cutext\{12\}\{1\}}
13 litres \texttt{\textbackslash Cutext\{13\}\{1\}}

and using (e.g.) package option \texttt{use-fmtcount-numerals=true}

one litre \texttt{\textbackslash cutext\{1\}\{1\}}
One litre \texttt{\textbackslash Cutext\{1\}\{1\}}
one to two litres \texttt{\textbackslash cutext\{1--2\}\{1\}}
One to two litres \texttt{\textbackslash Cutext\{1--2\}\{1\}}
twelve litres \texttt{\textbackslash cutext\{12\}\{1\}}
13 litres \texttt{\textbackslash Cutext\{13\}\{1\}}

You can customize the numeral functions used with \texttt{numeral-function} and \texttt{Numeral-function}. Furthermore, since v1.10 \texttt{\textbackslash cutext} and \texttt{\textbackslash Cutext} also allow their units to be changed (this behavior can be altered using \texttt{\textbackslash cutext-change-unit}):

\texttt{\textbackslash cusetup\{l ml\}}
1000 millilitres \texttt{\textbackslash cutext\{1\}\{1\}}
1000 millilitres \texttt{\textbackslash Cutext\{1\}\{1\}}
1000 to 2000 millilitres \texttt{\textbackslash cutext\{1--2\}\{1\}}
12000 millilitres \texttt{\textbackslash cutext\{12\}\{1\}}
13000 millilitres \texttt{\textbackslash Cutext\{13\}\{1\}}
? litres \texttt{\textbackslash Cutext\{?\}\{1\}}
\(\frac{1}{2}\) litres \texttt{\textbackslash Cutext\{1/2\}\{1\}}

\texttt{\textbackslash cuam} works like \texttt{\textbackslash cunum}, but without a unit, so changing units doesn’t affect it. Like \texttt{\textbackslash cunum} \_ and / are used to imply a (mixed) fraction and -- is used for ranges.

3 \texttt{\textbackslash cuam\{3\}}
2–3 \texttt{\textbackslash cuam\{2--3\}}
\(\frac{7}{9}\) \texttt{\textbackslash cuam\{2/3\}}
1\(\frac{3}{2}\) \texttt{\textbackslash cuam\{1\_2/3\}}

Furthermore it allows the concept of “phrases” (replacing a positive integer by a word; such as “12” becoming “dozen”\textsuperscript{6}) which can be activated by the option \texttt{use-phrases} (as I don’t know any english phrases, I switched the language to german for the following examples)

\textsuperscript{4}You can – of course – change this behavior, see section 8.
\textsuperscript{5}One could also say “exactly like”.
\textsuperscript{6}At least I think
3 Label & refs: Changing the amount of the recipe

What if you don’t want to change units, but the amounts of the recipe because you cook not for 4 persons, but for 2 and don’t like to do the math? Simple, use the following commands:

- \texttt{\culabel{⟨label⟩}{⟨number of persons⟩}}
- \texttt{\curef{⟨label⟩}}

The first one is the important one: It defines a \texttt{⟨label⟩} for a recipe which is initially for \texttt{⟨number of persons⟩}. Afterwards \texttt{⟨label⟩} can be used to tell the commands from section 2 that the given amounts are for \texttt{⟨number of persons⟩}. Each \texttt{⟨label⟩} must be unique and an error is raised if a \texttt{⟨label⟩} is already defined.

If you would like to print the number of persons this recipe is for, use \texttt{\curef}, which is fully expandable.

The following example uses \texttt{\culabel} to specify that the recipe is initially intended for 2 persons:

\begin{verbatim}
\culabel{recipe}{2}
\end{verbatim}

recipe for 2 persons:

- 10–20\,dag flour,
- $\frac{1}{2}$\,ℓ water,
- 10 gramme nuts,
- 2–3 eggs,
- 180°C (356°F) open fire

In combination with the option \texttt{set-number-of-persons} and \texttt{recalculate-amount} you can have this recipe changed to four persons:

\begin{verbatim}
% adding options:
\cusetup{set-number-of-persons=4,recalculate-amount=true}
\end{verbatim}

recipe for 4 persons:

- 20–40\,dag flour,
- 1\,ℓ water,
- 20 gramme nuts,
- 4–6 eggs,
- 180°C (356°F) open fire

(recipe for \texttt{\curef{recipe}} persons:\
\begin{verbatim}
\cunum<recipe>{10--20}{dag} flour,\\
\cunum<recipe>{1/2}{l} water,\\
\cutext[ref=recipe]{10}{g} nuts,\\
\cuam<recipe>{2--3} eggs,\\
\cunum<recipe>{180}{C} open fire
\end{verbatim}

\texttt{\cunum[C=F]{180}{C}} open fire

\end{verbatim}
Note that fractions are automatically evaluated and that only values with a (label) are changed (\texttt{\cunum{180}C} for example stays the same which also makes sense as the heat should be the same).

3.1 Rounding temperatures

By default temperatures are rounded to integers (using \texttt{round-precision=0}). Since v1.30 it is possible to round amounts to a negative precision. If you want to round temperatures to the tens see the following example (\texttt{cusetoptionfor} is described in section 8.2.1).

\begin{verbatim}
182 °C  \texttt{\cunum{182}C} \\
356 °F  \texttt{\cunum[C=F]{180}C} \\
144 °Ré \texttt{\cunum[C=Re]{180}C} \\
453 K   \texttt{\cunum[C=K]{180}C} \\
        \texttt{\cusetoptionfor(C,F,K,Re)\{round-precision=-1\}}
\end{verbatim}

4 Predefined units & some notes

In table 1 and you can find all predefined units which can be transformed into each other (sorted by group). Other predefined units (which cannot be used for transformations) are shown in table 2. Table 3 pretty much exists just for fun.

5 Defining units

New units can be defined using

\begin{itemize}
  \item \texttt{\declarecookingunit\{symbol/key-val-list\}\{unit-key\}}
  \item \texttt{\newcookingunit\{symbol/key-val-list\}\{unit-key\}}
  \item \texttt{\providecookingunit\{symbol/key-val-list\}\{unit-key\}}
\end{itemize}
Table 1: This table shows all units which can be transformed into each other, sorted by group. The columns “default” show the abbreviations used if no translation is defined for the given language. The translations used for \textit{cutext} and \textit{Cutext} are shown in appendix A. Note that “electron volt” exists just for fun.

These commands define the unit \textit{(unit-key)}. Note that \textit{(unit-key)} can neither contain / nor ; but it is allowed to be a command since v2.00 (see examples below).

If the key is not the same as the printed symbol use the optional argument. It can either contain the symbol you want printed or a key-value list (see below) for more advanced adjustments.

\texttt{\newcookingunit} raises an error if the unit is already defined, \texttt{\declarecookingunit} creates or (if given) overwrites \textit{(symbol)} and \texttt{\providecookingunit} does nothing if the unit is already defined. All units have male gender \texttt{m} by default (unless you change it using a key below).

Some examples:

\texttt{\declarecookingunit{kg}}
\texttt{\declarecookingunit{g}}
\texttt{\declarecookingunit[Msp.]{Msp}}
\texttt{\declarecookingunit[\ensuremath{\circ\text{\kern-\scriptspace C}}]{\text{\kern-\scriptspace C}}}
\texttt{\declarecookingunit{\circ\%} % can use commands now}

\textbf{Note:} The definition of the printed degree Celsius is copied and pasted from (a maybe older version of) siunitx.
Table 2: A (not only) spoonful of (more or less) country and language dependent units. Please note that sometimes a translation is nearly impossible as a unit (e.g. “saltspoonful”) may not exist in another language (like german; at least I never heard of it). So please only use units known to you. For “tablespoon” and “teaspoon” I used the german abbreviations “EL” and “TL” (because I forgot to change them initially).

<table>

</tbody>
</table>

symbol = \{\text{symbol}\}
gender = \{m/f/n\}
set-option = \{\text{key-val-list}\}
add-to-group = \{\text{group}\}
natural-unit = \{\text{true/false}\}

Those keys can only be used in the optional argument of \texttt{\textbackslash declarecookingunit}, \texttt{\textbackslash newcookingunit} or \texttt{\textbackslash providecookingunit}. They can be used to define some properties of the unit during its initialization.

\texttt{symbol} allows you to set the printed symbol of the unit. A similar effect can be achieved by just using the optional argument. Use this option if you want to use other keys during the definition. This symbol is used as a fallback for all languages, if no explicit symbol is found for said language.

\texttt{gender} sets the gender of the unit (default ist m). Allowed is m, f or n. Note that this sets the default gender for all languages.

\texttt{set-option} allows to add some key-vals to the specific unit which are activated once the unit is used. See page 17.

\texttt{add-to-group} adds the unit defined to \{\text{group}\}. See section 8.2.1 for more information.

\texttt{natural-unit} is a simple true/false switch. If \texttt{true} the unit will be specified to be a “natural-unit”. This is more or less a joke option.
\declarecookingderivatives \declarecookingderivatives {⟨unit-list⟩} {⟨unit-key⟩}%
{⟨mathematical-relation⟩} {⟨unit-symbol⟩}

This function is experimental. Defines new units which are a combination of the units given in ⟨unit-list⟩ and their key-chain. ⟨unit-key⟩, ⟨mathematical-relation⟩ and ⟨unit-symbol⟩ accept #1 to #n as arguments with n being the number of units given in ⟨unit-list⟩. n cannot be greater than 8 (and it will probably compile for quite a while). Also note that this command doesn’t work/isn’t tested for single keys.

Also note that it is quite possible that an “overflow-error” will occur if there are too many units.

Example: Your homework is to change the unit of energy kg m² s⁻² into oz in² min⁻². To check if you are correct you use \declarecookingderivatives:

\declarecookingderivatives{kg,m,s}{#1*#2:#3}
{ (#1)*(#2)^2/(#3)^2 } {\sfrac{#1\,#2^2}{#3^2}}

Using \cunum[kg*m:s=oz*in:min]{1}{kg*m:s} shows that 1 kg m²/s² is equal to 196829101.34 oz in²/min².

Note: As this is a bit more experimental and can easily lead to overflow-errors, no actual E\TeX keys are created with \declarecookingderivatives. Internally the keys and possible values are stored in a huge property list. If an unknown key is encountered, it checks if said key can be found in the property list.

6 Defining options to change units

Options (to change units) can be newly defined or added to already existing ones using

• \cudefinekeychain
• \cudefinesinglekey
• \cuaddtokeychain
• \cuaddsinglekeys
If you define new units (see section 5) and cannot add them to already existing keys you may use \texttt{\cudefinekeychain} or \texttt{\cudefinesinglekey} respectively to define new key-chains or single keys.

\texttt{\cudefinekeychain} collects the unit-key’s given and defines a key-chain. This allows you to change every unit into every other unit given in the list. So \langle unit-key-1 \rangle can take \langle unit-key-1 \rangle, \langle unit-key-2 \rangle, \langle unit-key-3 \rangle, ... as values; \langle unit-key-2 \rangle can take \langle unit-key-1 \rangle, \langle unit-key-2 \rangle, \langle unit-key-3 \rangle, ... as values, etc. Please note that \langle ... \rangle has to be a number.

Sometimes it is not that easy and the conversion of one unit into another needs are more complicated formula (see for example temperatures). If that is the case use \texttt{\cudefinesinglekey}. As the name says it defines only a single key \langle unit-key-1 \rangle with the values \langle unit-key-1 \rangle, \langle unit-key-2 \rangle, etc. The advantage of this command is that now \langle ... \rangle can be a formula and the numerical input of \texttt{\cunum}, etc. can be placed explicitly using \#1.

\textbf{Example:} This example defines following keys with their respective value:

- the key kg with the values kg, dag, g and oz
- the key dag with the values kg, dag, g and oz
- the key g with the values kg, dag, g and oz
- the key oz with the values kg, dag, g and oz
  
  \begin{verbatim}
  \cudefinekeychain
  \cudefinesinglekey{
  {{\langle \text{unit-key-1} \rangle} {\langle \text{value} \rangle} \\%
  \langle \text{unit-key-2} \rangle} {\langle \text{value} \rangle \langle \text{unit-key-1} \rangle} \\%
  \langle \text{unit-key-3} \rangle} {\langle \text{value} \rangle \langle \text{unit-key-1} \rangle} \\
  ...}
  \cudefinesinglekey{\langle \text{unit-key-1} \rangle}
  {
  \langle \text{unit-key-2} \rangle} {\langle \text{value} \rangle \langle \text{unit-key-1} \rangle} \\
  \langle \text{unit-key-3} \rangle} {\langle \text{value} \rangle \langle \text{unit-key-1} \rangle} \\
  ...
  }
  \end{verbatim}

1 kg = 1 kg 1 kg = 100 dag 1 kg = 1000 g
1 kg = 35.27399 oz 1 kg = 2.204 622 6 lb
\cudefinekeychain
{
    {d} { 1 }
    {h} { 24 } \%%% 1 day are 24 hours
    {min}{ 1440 } \%%% 1 day are 1440 minutes
    {s} { 86400 } \%%% 1 day are 86400 seconds
}

**Note:** The value of the first item can be something different from 1. So something like this is also possible:

\cudefinekeychain
{
    {kg} { 0.4535924 }
    {dag}{ 45.35924 }
    {g} { 453,5924 }
    {oz} { 16 }
    {lb} { 1 }
}

**Example:** To convert degree Fahrenheit to degree Celsius, kelvin and degree Réamur one needs the formulas\(^7\)

\[
T_C = (T_F - 32) \cdot \frac{5}{9} \\
T_K = (T_F - 459.67) \cdot \frac{5}{9} \\
T_{Re} = (T_F - 32) \cdot \frac{4}{9}
\]

with \(T_F\) being the input temperature in degree Fahrenheit and \(T_C\) being the same temperature in degree Celsius, etc. Using \cudesinglekey the key F with values C, K and Re is defined by:

\cudesinglekey {F}
{
    {C} { ( \#1 - 32 ) * 5/9 } \%%% see formulas above
    {K} { ( \#1 + 459.67 ) * 5/9 }
    {Re} { ( \#1 - 32 ) * 4/9 }
}

This defines the key F with the values F, C, K and Re.

\(^7\)See Wikipedia.
\cuaddtokeychain
\cuaddtokeychain
\cuaddsinglekeys
{
\langle \text{unit-key-1} \rangle \{ \langle \text{value} \rangle \}
\langle \text{unit-key-2} \rangle \{ \text{... unit-key-2 are } \langle \text{value} \rangle \text{ unit-key-1} \}
\langle \text{unit-key-3} \rangle \{ \text{... unit-key-3 are } \langle \text{value} \rangle \text{ unit-key-1} \}
\ldots
}
\cuaddsinglekeys{\langle \text{unit-key-1} \rangle}
{
\langle \text{unit-key-2} \rangle \{ 1 \text{ unit-key-2 are } \ldots \text{ unit-key-1} \}
\langle \text{unit-key-3} \rangle \{ 1 \text{ unit-key-3 are } \ldots \text{ unit-key-1} \}
\ldots
}
\cuaddtokeychain first parses through its unit-list and searches for a base unit key which is already in a key-chain (aka. was defined by \cudefinekeychain). The other units, not yet part of a key-chain, are added to the same key-chain as the base unit. So the newly added units are available as a key and a value for the other units in the same key-chain. Note that (...) must be a number.

If the conversion is more complicated use \cuaddsinglekeys. It adds \langle unit-key-2 \rangle, etc. as values to \langle unit-key-1 \rangle. The numerical input can be placed using \#1 (see \cudefinesinglekey). This command neither defines new keys nor does it add values to keys other than \langle unit-key-1 \rangle.

**Example:** Suppose you are British (I am sorry, I can’t think of another reason to use those units) and you want to implement ‘stone’ (yes, I was surprised myself that such a unit exists, but it even appears in a Sherlock Holmes story). You exactly know that 1 st equals 14 lb, well ... now you have two choices. \cuaddkeys or \cuaddtokeys (use the one best fitting). This example uses the first, the next the latter one.

\newcookingunit{st} %
\cuaddtokeychain
{
\{1lb\} \{ 14 \} % unit already in a key-chain.
\{st\} \{ 1 \} % new unit. 1st = 14lb
}

\cunum[lb=st]{1}{lb}
\cunum[st=lb]{1}{st}
\cunum[st=g]{1}{st}
\cunum[st=kg]{1}{st}
\cunum[kg=st]{1}{kg}
\cunum[st=kg]{16}{st}

**Note:** Of course using

\cuaddtokeychain
{
\{st\} \{ 1/14 \} % 1lb = 1/14st
\{lb\} \{ 1 \} % unit already in a key-chain.
}

is also possible
Example: Now you want to add degree Rømer and convert Celsius to degree Rømer:

\[ T_{Ro} = T_C \times \frac{21}{40} + 7.5 \]

%% defining new unit 'degree R{o}mer'
\newcookingunit \ensuremath{ \{ } \circ \ \text{kern-\scriptspace R{o}} \} \{Ro\}
\cuaddsinglekeys \{C\} \%% adds value 'Ro' to key 'C'.
\{{Ro}\ \#1 \times 21/40 + 7.5 \}
\cusetoptionfor{Ro}\{ round-precision = 0 \} \%% round to integer automatically

10 °C \cunum{10}{C}\n13 °Rø \cunum{[C=Ro]}{10}{C}

6.1 Obsolete Commands

\cudfkeys \cudfkeys\{\unit-key-1\}\n\{{\unit-key-2}\}\{\unit-key-1\ \text{are} \ ... \ \unit-key-2\}\n\{\unit-key-3\}\{\unit-key-1\ \text{are} \ ... \ \unit-key-3\}\n\{\unit-key-4\}\{\unit-key-1\ \text{are} \ ... \ \unit-key-4\}\n\}
\cudfkeys\{\unit-key-2\}\{\unit-key-1\ \text{are} \ ... \ \unit-key-2\}\n\{\unit-key-3\}\{\unit-key-1\ \text{are} \ ... \ \unit-key-3\}\n\{\unit-key-4\}\{\unit-key-1\ \text{are} \ ... \ \unit-key-4\}\n\}
\cudfkeys\{\unit-key-1\}\{\unit-key-2\}\{\unit-key-1\ \text{are} \ ... \ \unit-key-2\}\n\}
\cudfkeys\{\unit-key-2\}\{\unit-key-1\ \text{are} \ ... \ \unit-key-2\}\nThese commands are going to be obsolete at one point. It is advised to use \cudfkeychain instead.

\cudfkeys takes \{\unit-key-1\}\ as a "basis", defines a key with the name \{\unit-key-1\}\ and adds the values \{\unit-key-1\}', \{\unit-key-2\}', \{\unit-key-3\}', etc. Furthermore this command also defines the keys \{\unit-key-2\}', \{\unit-key-3\}', etc. with the same values as \{\unit-key-1\}'. Please note that \{\...\}\ has to be a number.

\cudtxtkeys\cudtxtkeys\{\unit-key-1\}\n\{\unit-key-2\}\{\unit-key-1\ \text{are} \ ... \ \unit-key-2\}\n\{\unit-key-3\}\{\unit-key-1\ \text{are} \ ... \ \unit-key-3\}\n\{\unit-key-4\}\{\unit-key-1\ \text{are} \ ... \ \unit-key-4\}\n\}
\cudtxtkeys\{\unit-key-1\}\{\unit-key-2\}\{\unit-key-1\ \text{are} \ ... \ \unit-key-2\}\n\}
\cudtxtkeys\{\unit-key-2\}\{\unit-key-1\ \text{are} \ ... \ \unit-key-2\}\nThese commands are going to be obsolete at one point. It is advised to use \cudtxtkeychain instead.

\cudtxtkeys takes the already defined key \{\unit-key-1\}\ as a "basis", and adds \{\unit-key-2\}', \{\unit-key-3\}', etc. to its values. Furthermore it adds those new values to other keys linked to \{\unit-key-1\}' and defines the new keys \{\unit-key-2\}', etc. with the same values as \{\unit-key-1\}'.

Works similar to \cudtxtkeys regarding the definition of keys.
7 Language support

Unit names and symbols depend on the language. To change the name and symbol for given language you can use \cudefinename; to only change symbols use \cude finesymbol.

Those are special keys (as they cannot be used as units). Not only are printed units language depending, but as is the decimal mark (., or ,) and the text which substitutes the range-sign. To set the decimal mark use decimal-mark (see examples below), to set the range-sign for \cutext and \Cutext use cutext-range-sign.

Note that cutext-range-sign is “overwritten” by the option cutext-range-sign. If the option is set, then the language symbol will be ignored.

Furthermore if you are using numerals you may also use the keys one(m), one(f) and one(n). Integers below a certain value (see option use-numerals-below) are written-out. The problem is that the written-out “1” depends on the gender of the word following (e.g. “ein Baum” (m), “eine Pflanze” (f) and “ein Auto” (n)). Use those keys to set the specific gender of “1” (see also examples below).

\cudefinename\{Language\}
{\{unit-key-1\} \{symbol-1\} \{singular-1\} \{plural-1\} \(gender\)
\{unit-key-2\} \{symbol-2\} \{singular-2\} \{plural-2\} \(gender\)
...
}

This command defines the names (and optionally the symbol) of the units printed in \cutext and \Cutext (and \cunum regarding the symbol) for the specific \(Language\). For details regarding \(language\) see the translations documentation.

If the plural form of the name differs from the singular form use \{plural\} to specify the plural form, else it will be equal to its singular form. The singular form is only used if the number in \cutext and \Cutext is equal to 1.

\(gender\) can be m (maskulin), f (feminin) or n (neutrum). If not given, m is used as default.

\cudefinename \{English\}
{\{kg\} \{kilogramme\}
\{oz\} \{ounce\}
\{h\} \{hour\} \{hours\}
\{C\} \{degree\celsius\} \{degrees\celsius\}
\{decimal-marker\} \{.\}
\{cutext-range-sign\} \{-to-\}
\{one(m)\} \{one\}
\{one(f)\} \{one\}
\{one(n)\} \{one\}
}

\cudefinename \{German\}
{\{kg\} \{Kilogramm\} \n
\cudefinesymbol \cudefinesymbol\{Language\} \{
    \{unit-key-1\} \{symbol-1\}
    \{unit-key-2\} \{symbol-2\}
    ...
\}

This command defines the symbols of the units printed in \cunum for the specific \langle Language \rangle. It works similar as \cudefinename, but only the symbols (and no names) can be set. For details regarding \langle Language \rangle see the translations documentation.

\cudefinesymbol \cudefinesymbol \{English\} \{
    \{decimal-mark\} \{.\}
    \{cutext-range-sign\} \{-to-\}
    \{one(m)\} \{one\}
    \{one(f)\} \{one\}
    \{one(n)\} \{one\}
\}

\cudefinesymbol \cudefinesymbol \{German\} \{
    \{decimal-mark\} \{,\}
    \{cutext-range-sign\} \{-bis-\}
    \{one(m)\} \{ein\}
    \{one(f)\} \{eine\}
    \{one(n)\} \{ein\}
\}

\cudefinesymbol \cudefinesymbol \{French\} \{
    \{l\} \{L\}
    \{dl\} \{dL\}
    \{cl\} \{cL\}
    \{ml\} \{mL\}
    \{decimal-mark\} \{.\}
    \{one(m)\} \{un\}
    \{one(f)\} \{une\}
    \{one(n)\} \{un\}
\}
Example: Imagine that instead of the abbreviation “dag” for “decagramme” you want to use “ducks” (because ... I don’t know). You can easily do this via

\cunum{12}{dag} weed
\cunum{3}{dag} nuts
\cunum{10}{dag} duckmeat

7.1 Phrases

Each language has synonyms for certain (integer) numbers. This package supports those phrases and they can be implemented with the following command to be used by \cuam:

\cunum{12}{Dutzend} <n> %% implemented by default
\cunum{60}{Schock} <n>
\cunum{6}{halbes\ Dutzend} <n>

Let’s just use them (german language activated!):
As you can see, “Schock” (60) is preferred over “Dutzend” (12) as it linked to the higher number. Furthermore, for 6 the phrase “halbes Dutzend” (half a dozen) is used, but because it is a star version it is not used for 18.

8 Options

Options in cooking-units can mostly be set globally using \cusetup or locally using the optional argument of the respective command (but not as a package option). The only exception is the option given in section 8.1 which needs to be used as a package option.

\cusetup{⟨options⟩}

Options can be set using \cusetup{⟨options⟩}.

\cusetoptionfor{⟨unit-list⟩}{⟨options⟩}
\cuaddoptionfor{⟨unit-list⟩}{⟨options⟩}
\cuclearoptionfor{⟨unit-list⟩}

cooking-units allows you to attach options to units. Those options are activated if (and only if) the specific unit is used or if another unit is converted into it. Those options allow you to e.g. round temperatures to integers automatically. Furthermore, those added options are overwritten by local options.

\cusetoptionfor sets ⟨options⟩ to each unit in ⟨unit-list⟩ overwriting the old ones.
\cuaddoptionfor adds ⟨options⟩ to each unit in ⟨unit-list⟩.
\cuclearoptionfor clears all options given to each unit in ⟨unit-list⟩.

Example: Temperatures C, F, K and Re are by default rounded to integers.

\cunum{75.23}{C}\ 
\cunum{75.23}{F}\ 
\cunum{75.23}{K}\ 
\cunum{75.23}{Re}\ 
\cusetoptionfor{C,F,K,Re}{round-precision=-1}\ 
\cunum{75.23}{C}\ 
\cunum{75.23}{F}\ 
\cunum{75.23}{K}\ 
\cunum{75.23}{Re}\ 
\cuaddoptionfor{C,F,K,Re}\ 
\cunum{75.23}{C}\ 
\cunum{75.23}{F}\ 
\cunum{75.23}{K}\ 
\cunum{75.23}{Re}\ 
\cuclearoptionfor{C,F,K,Re}\ 
\cunum{75.23}{C}\ 
\cunum{75.23}{F}\ 
\cunum{75.23}{K}\ 
\cunum{75.23}{Re}
8.1 Load time options

\usepackage[use-fmtcount-numerals=(true/false)]{cooking-units}

If set to true loads package fmtcount and uses \numberstringnum for \texttt{cutext} and \texttt{Numberstringnum} for \texttt{Cutext} to write-out numbers below \texttt{use-numerals-below} (13 by default), integers above are printed as numbers. You can decide to not print any numerals by setting \texttt{print-numerals} to false.

Note: You don’t need to use this function to use numerals. Using \texttt{print-numerals} and setting \texttt{numeral-function} and \texttt{Numeral-function} also works.

\begin{verbatim}
one kilogramme \texttt{cutext}{1}{kg}\\
One kilogramme \texttt{Cutext}{1}{kg}\\
two kilogramme \texttt{cutext}{2}{kg}\\
Two kilogramme \texttt{Cutext}{2}{kg}\\
twelve kilogramme \texttt{cutext}{12}{kg}\\
Twelve kilogramme \texttt{Cutext}{12}{kg}\\
13 kilogramme \texttt{cutext}{13}{kg}\\
13 kilogramme \texttt{Cutext}{13}{kg}\\
14 kilogramme \texttt{Cutext}{14}{kg}
\end{verbatim}

Note: \texttt{use-fmtcount-numerals} is a package option as it needs to load fmtcount which is not loaded by default.

Note: Please note the keys \texttt{one(m)}, \texttt{one(f)} and \texttt{one(n)} to change the printed “one” (as “one” is in many languages dependent on the gender of the following word. E.g in German: Masculine: ein Baum, Feminin: eine Pflanze, Neutrum: ein Auto).

Note: You can always change the functions used to print numerals with \texttt{numeral-function} and \texttt{Numeral-function}.

8.2 Normal options

Options in this subsection can only be set as local options or using \texttt{cusetup}, but not as load time options.

8.2.1 Unit Specific options

\begin{verbatim}<unit> \langle unit-key-1 \rangle = \langle unit-key-2 \rangle \end{verbatim}

Change \texttt{\langle unit-key-1 \rangle} to \texttt{\langle unit-key-2 \rangle} (see section 6 to define new options).
\begin{itemize}
\item \texttt{\cudeclareunitgroup \{group-name\} \{unit-list\}}
\end{itemize}

Defines the group \texttt{\{(group-name)\}} containing the list \texttt{\{(unit-list)\}}. This allows the usage of \texttt{\{(group-name)\}=\{unit-key\}} to change all units in the group \texttt{\{(group-name)\}} to \texttt{\{(unit-key)\}} (which has to be part of \texttt{\{(unit-list)\}}).

\begin{itemize}
\item \texttt{\cuaddtounitgroup \{(group)\}\{unit-list\}}
\end{itemize}

Adds \texttt{\{(unit-list)\}} to an already existing \texttt{\{(group)\}} (both need to exist).

\begin{itemize}
\item \texttt{\cudeclareunitgroup \{weight\} \{kg, dag, g, oz, lb, stick\}}
\end{itemize}

Example: Define the group “weight”:

\texttt{\cudeclareunitgroup \{weight\} \{ kg , dag, g, oz, lb, stick \}}

Now \texttt{\cusetup{weight=dag}} can be used to change all units contained in \texttt{weight} to \texttt{dag}.

\begin{itemize}
\item \texttt{\cuaddtounitgroup \{weight\}\{st\}}
\end{itemize}

Example: Adding \texttt{st} to the group \texttt{weight}

\texttt{\cuaddtounitgroup \{weight\}\{st\}}
\texttt{\cusetup{weight=g}}
\texttt{\cunum{1}{kg}}
\texttt{\cunum{1}{dag}}
\texttt{\cunum{1}{g}}
\texttt{\cunum{1}{oz}}
\texttt{\cunum{1}{lb}}
\texttt{\cunum{1}{stick}}
\texttt{\cunum{1}{st}}
\texttt{\cunum{6350.29}{g}}
add-unit-to-group =
{
    (group1) = {{unit-key-list}},
    (group2) = {{unit-key-list}},
    ...
}

This option is going to be obsolete at one point. Adds each (unit-key) in (unit-keys-list) to (group). The key-val equivalent of \cuaddtounitgroup.

set-option-for-unit-key> =
{
    (unit-key1) = {{key1 = value1, ...}},
    (unit-key2) = {{key1 = value1, ...}},
    ...
}

This option is going to be obsolete at one point. Sets and adds (key1=value1,...) to a specific (unit-key). erase-all-options (see below) is used to erase all options for all (unit-key)s.

The less flexible key-value version of \cusetoptionfor and \cuaddoptionfor.

set-option-for =
{
    (unit-key1) = {{keys=vals}},
    (unit-key2) = {{keys=vals}},
    ...
}

add-option-for =
{
    (unit-key1) = {{keys=vals}},
    (unit-key2) = {{keys=vals}},
    ...
}

This option is going to be obsolete at one point. Sets/adds each (keys=vals) to the specific (unit-key). Works pretty much the same way their set-option-for-(unit-key) and add-option-for-(unit-key) counterparts.

The less flexible versions of the commands \cusetoptionfor and \cuaddoptionfor.

erase-all-options =
{
    (unit-key1, unit-key2, ...)
}

This option is going to be obsolete at one point. Erase options added to units.

erase-all-options erases all options for all (unit-key)s.

erase-all-options-for is used to remove added options from the specified (unit-key)s (key-value version of \cuclearoptionfor).  

8.2.2 Command behavior

cutext-to-cunum = (true/false)

Want to get rid of all \cutext and \Cutext? Set this option to true and all \cutext and \Cutext are changed into \cunum.
1 kilogramme \\
2 kilogramme \\
½ kilogramme \\
? kilogramme \\
1000 to 2000 gramme \\
1 kg \\
2 kg \\
½ kg \\
? kg \\
1000–2000 g

\texttt{cutext-change-unit} \hspace{1cm} \texttt{cutext-change-unit = \langle true/false \rangle}

Set this option to \texttt{false} if you do not want the units of \texttt{cutext} and \texttt{Cutext} to be changed. Set to \texttt{true} by default.

\begin{verbatim}
1000 gramme \texttt{cutext [kg=g]{1}{kg}}\\
½ kilogramme \texttt{cutext [kg=g]{1/2}{kg}}\\
1000 to 2000 gramme \texttt{cutext [kg=g]{1--2}{kg}}\\
1 kilogramme \texttt{cutext [kg=g]{1}{kg}}\\
½ kilogramme \texttt{cutext [kg=g]{1/2}{kg}}\\
1 to 2 kilogramme \texttt{cutext [kg=g]{1--2}{kg}}
\end{verbatim}

\texttt{cuam-version} \hspace{1cm} \texttt{cuam-version = \langle old/new \rangle}

\texttt{cutext-version} \hspace{1cm} \texttt{cutext-version = \langle old/new \rangle}

Since v1.10 this package also parses and checks the input of \texttt{cutext} and \texttt{Cutext} and \texttt{cuam}. If you want to restore the old behavior, set this option to \texttt{old}, but note that then you can neither change the amounts for a given number of persons nor change the unit of \texttt{cutext} and \texttt{Cutext}. Both of them are set to \texttt{new} by default.

### 8.2.3Hooks

\texttt{commands-add-hook} \hspace{1cm} \texttt{commands-add-hook = \langle \texttt{code} \rangle}

\texttt{cunum-add-hook} \hspace{1cm} \texttt{cunum-add-hook = \langle \texttt{code} \rangle}

\texttt{cutext-add-hook} \hspace{1cm} \texttt{cutext-add-hook = \langle \texttt{code} \rangle}

\texttt{Cutext-add-hook} \hspace{1cm} \texttt{Cutext-add-hook = \langle \texttt{code} \rangle}

\texttt{cuam-add-hook} \hspace{1cm} \texttt{cuam-add-hook = \langle \texttt{code} \rangle}

Adds \langle \texttt{code} \rangle to the respective command (or in case of the first key: to all commands). The hook is executed after setting the keys, but before parsing and processing the input.

Please be careful with spaces, they will be printed.

**Example:** You would like to count how often all commands of this package are used. Simply add:

\begin{verbatim}
\newcounter{CookingUnitsCounter} \%% or however you like it
\cusetup{commands-add-hook={\stepcounter{CookingUnitsCounter}}}
\%% beware of spaces inside the add-hook keys.
\end{verbatim}
The following table lists how often each command is used in this documentation (with help of `totalcount`):

<table>
<thead>
<tr>
<th>command</th>
<th>times</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>\cunum</code></td>
<td>206</td>
</tr>
<tr>
<td><code>\cutext</code></td>
<td>62</td>
</tr>
<tr>
<td><code>\Cutext</code></td>
<td>27</td>
</tr>
<tr>
<td><code>\cuam</code></td>
<td>61</td>
</tr>
<tr>
<td><strong>total</strong></td>
<td><strong>356</strong></td>
</tr>
</tbody>
</table>

### 8.2.4 Input and Outputs

- **expand-both**
  
  expand-both = ⟨n/o/f/x⟩

- **expand-amount**
  
  expand-amount = ⟨n/o/f/x⟩

- **expand-unit**
  
  expand-unit = ⟨n/o/f/x⟩

By default the commands `\cunum`, `\cutext` and `\Cutext` do not expand their input. You can change the expansion behavior of ⟨amount⟩ and/or ⟨unit-key⟩ using the options specified above. The meaning of the available values are the same as specified in the LATEX3 document “interface3”.

It is set to `n` (no expansion) by default.

- **set-special-sign**
  
  set-special-sign = {⟨character(s)⟩}

- **add-special-sign**
  
  add-special-sign = {⟨character(s)⟩}

Allows ⟨character(s)⟩ to be used in the first mandatory argument of `\cunum`, `\cuam`, `\cutext` and `\Cutext` without raising an error (you can customize this behavior, see `set-unknown-message`). By default it is set to `?`. Please note that the sign `<` is not allowed as a special sign.

- `?kg`
  
  \cunum{?}{kg}\n
- `10?–20? kg`
  
  \cunum[g=kg]{10?--20?}{kg}\n
- `x kg`
  
  \cunum[x]{kg}\n
- `X–? kg`
  
  \cunum[X--?]{kg}\n
- `1 kg`
  
  \cunum[1]{kg}\n
- `1–2 kg`
  
  \cunum[1--2]{kg}\n
- **set-unknown-message**
  
  set-unknown-message = ⟨error/warning/none⟩

  Using a special sign ⟨?⟩ by default) causes a warning to be raised. Set this option to `error` if you want an error (as an extra emphasis), `warning` if you want a warning (default) and `none` if you don’t want to know anything about it.

- **set-cutext-translation-message**
  
  set-cutext-translation-message = ⟨error/warning/none⟩

  If a translation for `\cutext` and `\Cutext` is not available for the language, the commands are replaced by `\cunum`. Currently – if this is happening – a warning is shown, you may change the behavior of the message (error, warning or not showing at all) using this option.
**print-numerals** = \{true/false\}

Prints numerals for integers smaller than \texttt{use-numerals-below} if set to \texttt{true}. If set to \texttt{false} no numerals are printed.

If you use the package option \texttt{use-fmtcount-numerals} this option is automatically set to \texttt{true}.

If you want to use another package, just set this option to \texttt{true} and use \texttt{numeral-function} and \texttt{Numeral-function}.

**Example:** (Using the package option \texttt{use-fmtcount-numerals}:

\begin{verbatim}
one kilogramme \texttt{cutext}{1}{kg}\\
two kilogramme \texttt{cutext}{2}{kg}\\
twelve kilogramme \texttt{cutext}{12}{kg}\\
13 kilogramme \texttt{cutext}{13}{kg}\\
\texttt{cusetup}{print-numerals=false}\\
1 kilogramme \texttt{cutext}{1}{kg}\\
2 kilogramme \texttt{cutext}{2}{kg}\\
12 kilogramme \texttt{cutext}{12}{kg}\\
13 kilogramme \texttt{cutext}{13}{kg}\\
\end{verbatim}

\begin{verbatim}
use-numerals-below = \{integer\}

If \texttt{print-numerals} is \texttt{true}, prints the numerals in \texttt{cutext} and \texttt{Cutext} for integers smaller than \texttt{integer}. \texttt{integer} is by default 13. You can deactivate the printing of numerals by \texttt{print-numerals=false}.

\begin{verbatim}
one kilogramme \texttt{cutext}{1}{kg}\\
two kilogramme \texttt{cutext}{2}{kg}\\
twelve kilogramme \texttt{cutext}{12}{kg}\\
13 kilogramme \texttt{cutext}{13}{kg}\\
\texttt{cusetup}{use-numerals-below=10}\\
one kilogramme \texttt{cutext}{1}{kg}\\
two kilogramme \texttt{cutext}{2}{kg}\\
12 kilogramme \texttt{cutext}{12}{kg}\\
13 kilogramme \texttt{cutext}{13}{kg}\\
\texttt{cusetup}{use-numerals-below=0}\\
1 kilogramme \texttt{cutext}{1}{kg}\\
2 kilogramme \texttt{cutext}{2}{kg}\\
12 kilogramme \texttt{cutext}{12}{kg}\\
13 kilogramme \texttt{cutext}{13}{kg}\\
\texttt{cusetup}{use-numerals-below=12001}\\
one thousand gramme \texttt{cutext}[kg=g]{1}{kg}\\
two thousand gramme \texttt{cutext}[kg=g]{2}{kg}\\
twelve thousand gramme \texttt{cutext}[kg=g]{12}{kg}\\
13000 gramme \texttt{cutext}[kg=g]{13}{kg}\\
\end{verbatim}

23
numeral-function = ⟨function⟩

Sets the functions used for printing numerals. numeral-function is used for lowercase, Numeral-function for capitalized cases.

Example: Using the commands from fmtcount you can set the numeral function equal to

\cusetup{
  numeral-function = \numberstringnum,
  Numeral-function = \Numberstringnum
}

(this happens if you use the package option use-fmtcount-numerals)

parse-number = (true/false)

If set to false prints the number of \cunum, \cutext, \Cutext and \cuam as they are (after some ... well ... parsing due to "_ "). Is set to true by default.

\cusetup{parse-number=false}
\cunum[kg=g]{1}{kg}\n\cunum{1--2}{kg}\n\cunum{1------------2}{kg}\n\cunum{1.2}{kg}\n\cunum[kg=g]{1,2}{kg}\n\cunum{1/2}{kg}\n\cunum{1_2/3}{kg}\n\cunum{1/2_3}{kg}\n\cunum{someweirdstuff}{kg}\n\cutext{1}{kg}\n\cutext{100}{kg}\n\cutext{gjfak}{kg}\n\cutext{12}{kg}\n\cutext[kg=g]{12}{kg}\n\cuam{1--------2}\n\cuam{1,2}\n\cuam{1_1/2}\n\cuam{kwflk}\n\cuam[kwflik]{kg}

range-sign = ⟨⟨string⟩⟩
cunum-range-sign = ⟨⟨string⟩⟩
cutext-range-sign = ⟨⟨string⟩⟩

cunum-range-sign sets the printed range sign used in \cunum (and \cuam) to ⟨⟨string⟩⟩, cutext-range-sign sets the printed range sign used in \cutext and \Cutext to ⟨⟨string⟩⟩. Using range-sign sets the range signs for both \cunum (and \cuam) and \cutext/\Cutext to ⟨⟨string⟩⟩.

The default for ⟨⟨string⟩⟩ is -- (for both).

Since version 1.45 there also exists the language symbol cutext-range-sign (see section 7). If the option cutext-range-sign is set the language symbol will be ignored.
1–2 kg
1–2
to 2 kilogramme
1 to 2 kilogramme
1–2 kg
1–2
to 2 kilogramme
1 to 2 kilogramme

use-phrases use-phrases = ⟨true/false⟩

Setting this option to true replaces certain integers (see section 7.1 for more information) with their phrase counterpart. This option is set to false by default.

Example: For the German language:

\selectlanguage{ngerman}
12 \cuam{12}\n12–24 \cuam{12--24}\n36 \cuam{36}\n1 Dutzend \cuam{12}\n1–2 Dutzend \cuam{12--24}\n3 Dutzend \cuam{36}\nein Dutzend \cuam{12}\nein bis zwei Dutzend \cuam{12--24}\ndrei Dutzend \cuam{36}\n
8.2.5 Rounding options

round-precision round-precision = ⟨integer⟩

Rounds the amount automatically to ⟨integer⟩ digits after the colon. Note that units like C, F, K and Re are still rounded to integers due to \cusetoptionfor.
\cusetup{round-precision=5}
1.23457 kg
\cunum{1.23456789}{kg}\\
0.01259 kg
\cunum[g=kg]{12.587}{g}\\
194 kg
\cunum{194}{kg}\\
392–410 ºF
\cunum[C=F]{200--210}{C}\\
−273 ºC
\cunum[K=C]{0.0012}{K}\\
\cusetup{round-precision=1}
1.2 kg
\cunum{1.23456789}{kg}\\
12.6 kg
\cunum{12.58}{kg}\\
0.2 kg
\cunum[g=kg]{194}{g}\\
392–410 ºF
\cunum[C=F]{200--210}{C}\\
−273 ºC
\cunum[K=C]{0.0012}{K}

Note: Negative numbers are also allowed.

\cusetoptionfor{C,F}{round-precision=-1}
−270 ºC
\cunum{-271,2}{C}\\
−270 ºC
\cunum[K=C]{0.0012}{K}\\
180 ºC
\cunum{185}{C}\\
360–390 ºF
\cunum[C=F]{180--200}{C}\]

---

**round-to-int** \text{round-to-int = (true/false)}

This option is deprecated. Rounds the amount to an integer if set true. Use \text{round-precision=0} instead.

**round-half** \text{round-half = (default/commercial)}

This option is only important for half-way numbers (e.g. 0.005). By setting it to default the value will be rounded to the nearest even number. Setting it to commercial rounds the value away from zero.

It is set to default by \ldots default.

Note: default actually refers to the fact that it is the default rounding algorithm used by \texttt{fp_eval:n \{ round( ) \}} without a third argument.

\cusetup{round-half=default}
0 kg
\cunum{0.005}{kg}\\
−0 kg
\cunum{-0.005}{kg}\\
1.24 kg
\cunum{1.245}{kg}\\
\cusetup{round-half=commercial}
0.01 kg
\cunum{0.005}{kg}\\
−0.01 kg
\cunum{-0.005}{kg}\\
1.25 kg
\cunum{1.245}{kg}

---

### 8.2.6 Fractions

**eval-fraction** \text{eval-fraction = (true/false)}

This option takes true or false as values. If set to true all fractions are evaluated. Please note that divisions through zero are not allowed.
convert-fraction convert-fraction = (true/false)

By default units of fractions are not converted into another unit. Setting this option to true allows fractions to be evaluated when a change of units is requested (and only if a change of unit is requested).

\csetup{eval-fraction=true}

0.33 kg \cunum{1/3}{kg}\
0.5 kg \cunum{1/2}{kg}\
500 g \cunum[kg=g]{1/2}{kg}\
1.5 kg \cunum{1_1/2}{kg}\
1500 g \cunum[kg=g]{1_1/2}{kg}\
−1500 g \cunum[kg=g]{-1_1/2}{kg}\
1\frac{1}{2} kg \cunum[kg=g]{1_2/?}{kg}\

fraction-command fraction-command = \command

Sets the command used for printing fractions equal to \command. \command has to take two arguments. By default it is equal to \sfrac from xfrac.

Please note that the amount is not printed inside a math environment by default.

\newcommand\myfrac[2]{#1/#2}
\csetup{fraction-command=\myfrac}

1/8 \cuam{1/8}\
1/2 kg \cunum{1/2}{kg}\
4/5 °C \cunum{4/5}{C}\
12/3 kg \cunum[1_2/3]{kg}\
\csetup{fraction-command=\nicefrac}

1/8 \cuam{1/8}\
1/2 kg \cunum{1/2}{kg}\
4/5 °C \cunum{4/5}{C}\
1\frac{1}{2} kg \cunum[1_2/3]{kg}\

fraction-inline fraction-inline = {(input containing #1 and #2)}

Similar to fraction-command only that you don’t have to define a command to alter the output of the fraction.
\cusetup{fraction-inline={#1/#2}}
\cuam{1/8}\\ \cunum{1/2}{kg}\\ \cunum{4/5}{C}\\ \cunum{1_2/3}{kg}\ \cusetup{fraction-inline={\nicefrac{#2}{#1}}}  
\cuam{1/8}\\ \cunum{1/2}{kg}\ \cunum{4/5}{C}\\ \cunum{1_2/3}{kg}

\cuam{1/2}\ \cunum{1/2}{kg}\ \cunum{4/5}{C}\ \cunum{1_2/3}{kg}

8.2.7 Spaces

\textbf{mixed-fraction-space} \hspace{1em} \texttt{mixed-fraction-space = \{length\}}

Sets the length between the fraction and the number in a mixed-fraction, default is 0.1em (because I said so; if someone has some literature or sources to look up the space, please let me know).

\begin{verbatim}
1\f{2/3} \cuam{1_2/3}\;1\f{2/3} \\
1\f{2/3} kg \cunum{1_2/3}{kg}\;1\f{2/3} kg \\
10\f{2/3} kg \cunum{10_2/3}{kg}\;10\f{2/3} kg \\
1 \f{2/3} \cuam{1_2/3}\;1 \f{2/3} \\
1 \f{2/3} kg \cunum{1_2/3}{kg}\;1 \f{2/3} kg \\
10 \f{2/3} kg \cunum{10_2/3}{kg}\;10 \f{2/3} kg
\end{verbatim}

\textbf{cutext-space} \hspace{1em} \texttt{cutext-space = \{string\}}

The \texttt{\textit{string}} is inserted between the numeral part and the unit part when using \texttt{\textit{cutext}} and \texttt{\textit{Cutext}}. By default it is set an unbreakable space \texttt{~}.

\begin{verbatim}
\cutext{1}{kg}\;1\text{ kilogramme} \\
\Cutext{10}{kg}\;10\text{ kilogramme} \\
\cutext{1}{kg}\;1\text{ kilogramme} \\
\Cutext{10}{kg}\;10\text{ kilogramme} \\
\cutext{1}{kg}\;1\text{ kilogramme} \\
\Cutext{10}{kg}\;10\text{ kilogramme} \\
\cutext{1}{kg}\;1\text{ kilogramme} \\
\Cutext{10}{kg}\;10\text{ kilogramme}
\end{verbatim}
phrase-space  \[\text{phrase-space} = \{\langle\text{string}\rangle\}\]

\(\langle\text{string}\rangle\) is inserted between the numeral part and the phrase part while using \texttt{\cuam}. By default it is set to the unbreakable space \texttt{~}. Use this option if you want to e.g. insert a normal space.

(Switching to german)

\texttt{\selectlanguage{ngerman}}

\begin{verbatim}
1 Dutzend \texttt{\cuam{12}}
12 Dutzend \texttt{\cuam{144}}\cusetup{phrase-space={space}}
1 Dutzend \texttt{\cuam{12}}
12 Dutzend \texttt{\cuam{144}}\cusetup{phrase-space={}}
1Dutzend \texttt{\cuam{12}}
12Dutzend \texttt{\cuam{144}}\cusetup{phrase-space={qwe}}
1qweDutzend \texttt{\cuam{12}}
12qweDutzend \texttt{\cuam{144}}
\end{verbatim}

amount-unit-space  \[\text{amount-unit-space} = \{\langle\text{string}\rangle\}\]

Change the spacing for \texttt{\cunum} between the printed amount(s) and the unit. The default value is \texttt{\hspace{1em}}.

\begin{verbatim}
1 kg \texttt{\cunum{1}{kg}}
\frac{1}{2} kg \texttt{\cunum{1/2}{kg}}
1\text{–}2 kg \texttt{\cunum{1\text{–}2}{kg}}\cusetup{amount-unit-space={\hspace{1em}}}
1 kg \texttt{\cunum{1}{kg}}
\frac{1}{2} kg \texttt{\cunum{1/2}{kg}}
1\text{–}2 kg \texttt{\cunum{1\text{–}2}{kg}}\cusetup{amount-unit-space={}}
1 kg \texttt{\cunum{1}{kg}}
\frac{1}{2} kg \texttt{\cunum{1/2}{kg}}
1\text{–}2 kg \texttt{\cunum{1\text{–}2}{kg}}\cusetup{amount-unit-space={qwe}}
1qwe kg \texttt{\cunum{1}{kg}}
\frac{1}{2} qwe kg \texttt{\cunum{1/2}{kg}}
1\text{–}2 qwe kg \texttt{\cunum{1\text{–}2}{kg}}
\end{verbatim}

8.2.8 label & refs

recalculate-amount  \[\text{recalculate-amount} = \{\text{true/false}\}\]

Set this option to \texttt{true} if you want to change your recipes to the given number of people set by \texttt{set-number-of-persons}. Note that only those values who have a label are changed.
**set-number-of-persons**

\texttt{set-number-of-persons = \langle integer \rangle}

With this option you can determine the number of people your recipes are for. Note that this option only has an effect on those who have a \texttt{label} given. It is set to 4 by default. Please also note the use of \texttt{recalculate-amount}.

\begin{verbatim}
\cusetup{recalculate-amount=true}
\end{verbatim}

\begin{verbatim}
\cusetup{set-number-of-persons=3}
\end{verbatim}

\begin{verbatim}
\cusetup{set-number-of-persons=2}
\end{verbatim}

\begin{verbatim}
\cusetup{set-number-of-persons=1}
\end{verbatim}

**label**

\texttt{label = \langle \langle string \rangle* \langle integer \rangle \rangle}

The key-value version of \texttt{\cutilabel}. It defines the label \texttt{\langle string \rangle} which is originally for \texttt{\langle integer \rangle} people. Please note that the \texttt{*} is mandatory as it separates the string from the integer. Each label is defined globally and must be unique.

\begin{verbatim}
\cusetup{label=Toast*1}
\end{verbatim}

**get-label**

\texttt{get-label = \langle \langle label \rangle \rangle}

The key-value version of \texttt{\curef}. Note that this key doesn’t save the value inside a macro but rather prints it directly into the document.
\cabel{Schinken}{3}
\cusep{get-label=Schinken}\\\n\curef{Schinken}\\
\cusep{recalculate-amount=true}
\curef{Schinken}\\

\cabel{Kaese}{3}
\cunum<Kaese>[m=dm]{1}{m}\\\n\cunum[Kaese][ref=Kaese,m=dm]{1}{m}\\\n\cusep{recalculate-amount=true}
\cunum[Kaese][ref=Kaese,m=dm]{1}{m}\\\n
\curef-add-forbidden-unit = {\langle unit list \rangle}
\curef-remove-forbidden-unit = {\langle unit list \rangle}
\curef-clear-forbidden-units = {true/false}

Note: \curef is expendable.

\begin{itemize}
  \item ref \ref = {\langle label \rangle}
\end{itemize}

Instead of using the first optional arguments of the commands in section 2 you may use this option. It requires a valid value and throws an error if \langle label \rangle is not defined.

\cabel{check}{2}
\cusep{recalculate-amount=true}
\cunum<check>[m]{1}{m}\\\n\cunum<check>[m]{1}{kg}\\\n\cunum<check>[C]{1}{C}\\\

There are units which do not depend on the number of folks you are cooking for, units measuring the temperature are an example. Changing those units with the label & ref system would be accidental and in the best case throw an error. With the following options you can add units to the “forbidden unit list”, remove them and clear the whole list entirely.

By default the list contains C, F, K and Re.

\cabel{check}{2}
\cusep{recalculate-amount=true}
\cunum<check>{1}{m}\\\n\cunum<check>{1}{kg}\\\n\cunum<check>[C]{1}{C}\\\

31
8.3 Weird options

<table>
<thead>
<tr>
<th>check-temperature</th>
<th>\texttt{check-temperature = (true/false)}</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Checks if the used temperature is below absolute zero. Currently C, F, K and Re are supported. While \texttt{\textbackslash{cunum}(0)-K} is ok, \texttt{\textbackslash{cunum}(1)-K} raises an error, same for the others. Is set to \texttt{false} by default. To add new units see \texttt{add-temperature-to-check}.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>add-temperature-to-check</th>
<th>\texttt{add-temperature-to-check =}</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>{ \textlangle unit-key-1 \rangle = \langle minimum-value-1 \rangle , \textlangle unit-key-2 \rangle = \langle minimum-value-2 \rangle , \ldots }</td>
</tr>
<tr>
<td></td>
<td>This option adds \langle unit-key-1 \rangle and so on to the list of units to be checked if \texttt{check-temperature} is active. The argument can be a comma-separated list of \langle unit-key \rangle = \langle minimum-value \rangle. This sets the allowed minimum value of \langle unit-key \rangle to \langle minimum-value \rangle.</td>
</tr>
</tbody>
</table>

**Example:** This package implements the allowed minimum values for the temperatures C, F, K and Re to be checked if \texttt{check-temperature} is active using:

\begin{verbatim}
\cusetup
{ add-temperature-to-check =
  \{ K = 0, C = -273.15 , F = -459.67 , Re = -218.52 \}
}
\end{verbatim}

If you want to add a new value, for example degree Rømer (which has be defined in another example) you can write:

\begin{verbatim}
\cusetup
{ add-temperature-to-check = \{ Ro = -135.90375 \}
}
\end{verbatim}

<table>
<thead>
<tr>
<th>convert-to-eV</th>
<th>\texttt{convert-to-eV = (true/false)}</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Converts (nearly) every unit in table 1 to electron volt or the respective derivative (if possible). Note that this option is: a) experimental and probably will forever be and (b) just a joke, you are not supposed to use this units in a cookery book (and as you see this package doesn’t support the arrangement of such huge numbers). Also you may want to check the values if you really want to use them, just to be sure (I’ve checked them several times and hope they are finally correct, but mistakes happen).</td>
</tr>
</tbody>
</table>
\[560958865000000000000000000000000000\text{eV}\]
\[130148929500000000\text{c}^2\text{eV}^3\]
\[62415091260000000000\text{eV}\]
\[5067730.76\text{c}^3\text{ℏ}/\text{eV}\]
\[0.02\text{eV}\]
\[1519267461000000\text{ℏ}/\text{eV}\]

---

**add-natural-unit**

\text{add-natural-unit} = \langle \text{unit-key} \rangle

This option adds \langle \text{unit-key} \rangle to the list of units \text{convert-to-eV} uses to determine how a unit is transformed if set to \text{true}.

\[42 = \langle \text{true/false} \rangle\]

Take a good guess.

\[42\text{kg}\]
\[42\text{g}\]
\[42\text{J}\]
\[42^\circ\text{C}\]
\[42\frac{\text{s}}{\text{s}}\]
\[42\text{--}42\text{min}\]
\[42(!)\ell\]

---

**nothing-special**

\text{nothing-special} = \langle \text{true/false} \rangle

Options that do ... stuff. The four stages of madness in option for.

\text{nothing-special} is your default. The package behaves as intended.

\text{going-bonkers} is a bit more strange. It converts an unit into another random unit (if it can) and does so throughout the document. So if \text{unit-A} is converted into \text{unit-B}, it is going to be converted this way the entire document through. For an unit to be converted it must have a key, see section 6.

\text{fully-bonkers} converts one unit into another random unit (if it can) and does so for each unit it encounters. So \text{unit-A} might be converted into \text{unit-B} the first time, but \text{unit-C} the second. Each conversion picks a random unit for the conversion (but the conversion itself makes sense, e.g. \text{kg} into \text{g}, but not into \text{cm}).

\text{xD-lol} is pure insanity. A unit is transformed into another, if it makes sense or not, and its value is replaced by a random number.
9 Bugs & Feedback

Bug reports are always welcome. If you are sending a bug report please include a minimal working example showing the bug and a short description. If you use mail please add `cooking-units` to the e-mail header. GMX has the habit of putting e-mails into the spam account and adding `cooking-units` to the header makes it easier to recognize those e-mails. It can also take longer of GitHub, but I hope I figured out how to get a mail if a new issue is created (by not me).

Feedback and requests (commands, units, etc.) are also welcome. Please also add (if possible) an example of the desired output into the minimal example (and – if by mail – add `cooking-units` to the header).

Furthermore, as you can see I am not able to speak too many languages (german and english to be precise; I managed to add french with the help of the internet, which is not optimal) so if you are able to speak a language not yet implemented and would like to help you can send me the translations known to you. A list of all units (and their current translations) is given in appendix A.
Unsinn, Stella, Unsinn; was soll mir zustoßen? Sie kennen mich alle: Männer, die eine Rute lange sind, gibt es wenige in Palermo.” (see [1] page 25)

Stone [st] 6.35 kg. According to a fellow student this unit is still used in Great Britain. I’ve also recently found it in a video game; in the german translation of said video game to be precise. Why is the german translation using stone and not kilogram (at least in braces)?

As we had expected, the telegramm was soon followed by its sender, and the card of Mr. Cyril Overton, Trinity College, Cambridge, announced the arrival of an enormous young man, sixteen stone [101.6 kg] of solid bone and muscle, who spanned the doorway with his broad shoulders [...] (see [2] page 988)

(Story “The missing Three Quarters”)

Foot [ft] Equals exactly 0.3048 m or 12 in.

A bit of a strange unit (for me at least). Where I am from, people tend to have different feet sizes. Also present in the german translation of the video game that uses “Stone”.

degree Réamur [°Ré] Like degree Celsius, but instead of having the water boiling at 100° (Celsius), water boils at 80°. Water thankfully still freezes at 0°. Don’t think that this unit is used anymore. I think I learned about in physics.
Ell  Just read the Wikipedia article.

Fun Fact: At the Stephansdom in Vienna left of the main entrance are two metal bars. One is the “Tuchelle” (drapery ell, circa 78 cm), the other the “Leinenelle” (linen ell, around 89.6 cm).

cup  I think the idea of having a “cup” and it not being equal to 250 ml is a bit strange, for me at least. What other sizes can a cup have? I can imagine 500 ml, but are there other sizes?

stick  A unit I’ve made fun of because it is quite regional and doesn’t make any sense for foreigners. Then I realized that I am using the unit “Packerl” in my cookery book which is also quite locally\footnote{And maybe doesn’t even exist outside my family} and – even worse – the weight changes depending the content (See Packerl).

Packerl\de (small bag)  I’m a bit split on this unit as I don’t actually know if it exists. The reason I have the unit Packerl for my cookery book is that in Austria you can buy baking powder, (dry) Germ, Natrium, etc. in small bags (similar to stick). The problem: Depending on the content, the weight of Packerl differs. Not only that, but it can also differ between different producers (but not more than 2 g bzw. 0.07 oz). Here is a table:

| Packerl Backpulver (baking powder) | 16 g (0.56 oz) |
| Natrium | 14 g (0.49 oz) |
| Vanillin(-zucker) (vanillin(-sugar)) | 8 g (0.28 oz) |
| Germ* | 7 g (0.25 oz) |

\*Tockengerm (dry Germ) to be precise

For what kind of thing do I need Natrium for?

A Translations

This section contains the list of available translations. Each table shows the available translations regarding the unit symbol, the unit name (printed if \cutext or \Cutext is used) and the plural form (if different from the singular form). A second table shows the translations used for phrases (if given).

If a translation is not available a “—” is shown.

If the spoons should be extra full:
- cuillère à soupe rase
- cuillère à café rase
B US, Imperial and Other units

As source [5] has been used for imperial units, while [4] and [3] were used for U.S. units. I hope someone will find this bringing together useful.

| 1 yard | 0.9144 m (exact) |
| 1 yard | 3 foot |
| 1 yard | 36 Inch |
| 1 Inch | 0.0254 m (also exact) |

| 1 liter | 1 dm³ |
| 1 gallon | 4.54609 liter (exact) |
| 1 gallon | 4 Quart |
| 1 gallon | 8 Pint |
| 1 gallon | 32 Gill |
| 1 gallon | 160 fl. oz |
| 1 fl. oz | 0.0284130625 liter |
| 1 fl. oz | 0.0295735295625 liter |

Note 1: I think the American fl. oz U.S. is more common. Maybe. Most bottles have something like 10 fl. oz, which they say is equal to 30 ml. This would work really well with fl. oz U.S..

Note 2: Sometimes “fl. oz” is written without the dot. I am also not sure what kind of spacing has to be between “fl.” and “oz” (currently using \hspace{0.25pt}).

Note 3: This maybe sounds stupid, but could we introduce something like “flouz”, “floiz” and “floez”? “flouz” would be “fl. oz U.S.”, “floiz” would be “Imperial fl. oz” and “floez” would simply be equal to 30 ml?

For “stick” see [6].

| 1 lb | 0.45359237 kg (exact) |
| 1 lb | 16 oz |
| 1 lb | ½ st |
| 1 lb | 175/12 ounce troy |
| 1 lb | 4 stick |

| 1 cup ≈ 0.25 litre | = 250 ml |
| 1 tablespoon ≈ 0.015 litre | = 15 ml |
| 1 teaspoon ≈ 0.005 litre | = 5 ml |

Note 1: I tested the approximation for tablespoon with water (1 mg ≈ 1 mg) and the approximation looks good enough. It of course depends on how full you fill your spoon.

If you ever encounter in a german cookery book the word “Packerl”, check out its entry in section 10.

References

Change History

2016/06/11
General: Added the package option to load 'fmtcount'.

2016/08/31
General: Fixed calculation: degree Reamur to eV
Initial version

2016/09/03
General: Added units 'ssp', 'csp', 'dsp'
British English: 'pinch' is written in full
English unit: litre (and only litre) uses the curly l ℓ now
Separated Messerspitze and pinch

2016/09/05
General: New message: 'obsolete-command'
Replaced \cufrac by \cuam

2016/09/09
General: \@@_calculate_input_and_store_in:n optimiert durch neue property-key: single.
Add 'single' to property list of singlekeys.
Changed name from \@@_cumum_parse_range (and derivatives) to \@@_cutext_parse_range.
Changed name from \@@_parse_fraction_in_input:www to \@@_parse_mixed_fraction_in_input:www

2016/09/16
General: Only use \phantom if the argument (for \phantom) is not empty.

2016/09/26
General: \caddsinglekeys now tests if the unit exists (it didn’t before).
New option (and needed macros): add-temperature-to-check.
New option: 'round-half'.
Recalculated all electron volt values for conversion (as 'kg' was wrong before). Let’s hope they are correct this time.
Replaced \prop_clear_new:c by \prop_clear:c.

2016/10/19
General: 'convert-to-eV' now also as optional argument available.
Option 'load-time-option' now spells 'available' correct.
Update of documentation.

Corrected mistake: 'ELektronenvolt' (note uppercase L) to 'Elektronenvolt' in german.
Delete 'single' from property lists of singlekeys cause it is not as safe as I thought.
In \@@_cutext_default:nnn it is only checked once if a range is inside.

Delete 'single' from property lists of singlekeys cause it is not as safe as I thought.
In \@@_cutext_default:nnn it is only checked once if a range is inside.

In \@@_cutext_default:nnn it is only checked once if a range is inside.
Use \keys_set:n only if second argument is not empty. 

2016/10/28
General: \cutext (and \Cutext) and \cunum now parse their input like \cutext. This is needed as they also need to be changed. 
Start implementation of “Change recipe from n to m persons.”

2016/10/29
General: Tiding code: Now every command is separated into a “calc” function, a “print numeric value” and a “print unit” (if there) function. At least, that’s the plan.

2016/11/07
General: Fractions should now deal correctly with minus signs.

2016/11/13
General: \cutext, \Cutext and \cuam check their input, allows conversion of units.
Change amounts for specific number of persons.
New commands: \culabel and \curef.
New commands: \declarecookingunit and \providecookingunit.
New options: \cuam-version and \cutext-version.
New options: \cutext-to-cunum, \cutext-change-unit and \cutext-space.
New options: \recalculate-amount and \set-number-of-persons.
New options: \amount-unit-space, \label, \get-label, \ref.

2017/03/10
General: \curef is now defined by \NewExpandableDocumentCommand instead of the Declare variant.
Removed \translate and others from code and replaced them with wrapper-macros.
Removed things like 'cu-unit' from translate input and placed them into separate t'l's.

2017/10/23
General: Added “phrases.”
Added unit “stick” (of butter).
New option: \amount-unit-space.
New option: \phrase-space.
New option: \print-numerals.
New option: \set-cutext-translation-message.
New option: \use-phrases.
Now checks for ranges if both values can be printed as numerals (if activated) (bug fix).
Replaced \translator by \translations.
Reworked quite a lot of code.

2018/04/20
Allow round precision to be negative.
Change large portions of code.
Cooking Units-keys are not allowed to contain either “,” or “/”.
Fix argument specifiers.
Introduce key-groups (weight, volume, etc.).
New feature: Hooks.
New Option: 42.
New option: \add-unit-to-group.
New option: \erase-all-options-for.
New options: \expand-both, \expand-amount, \expand-unit.
New options: \set-option-for & \add-option-for.
New parsing algorithm. Hopefully better error recovery (if signs for fractions are in wrong order e.g.)
Option: \add-natural-unit.

2018/06/05
General: \set-unknown-message: Fix default value.
Add “range-sign” for translations (not usable yet).
Bugfix (phrases): Use the phrase from the first amount to check the second (and don’t parse through the second amount).
Bugfix (unit-change): \convert-to-eV can be again used as a local argument.
true) will print the second word smaller.
Change (amount-not-known):
Change message a bit.
Convert \clist to \seq if possible.
Fix some more argument specifiers.
Improve error-recovery by a lot.|\hdpindex
Remove unnecessary variants.
Renaming of some internal commands. .................. 1
Rework parsing code (again). This is basically an improved version of the old parsing algorithm, there is no huge version change. .................. 1
This version introduces mayor internal changes. For users not many things change. .................. 1

2018/09/24
General: Changes prefix from cooking_units to cookingunits. 1
Improved french (not in general, only for this package) 1
New language symbols: cutext-range-sign .................. 1
New section in documentation. .................. 1
Remove exhaustive expansion from internals (shouldn’t change anything for users) 1

2021/03/21
General: Adding keys to unit definition. .................. 1

Index

The italic numbers denote the pages where the corresponding entry is described, numbers underlined point to the definition, all others indicate the places where it is used.
